Interference of light

constructive

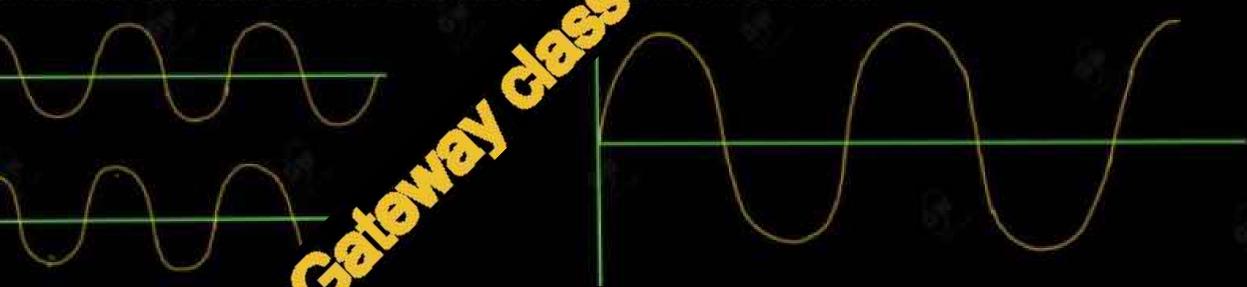

It is the phenomena of redistribution of intensity of light on account of superposition of light waves coming from the two Coherent sources of light (i.e. same frequent constant phase difference)

Types of Interference

(i) Constructive interference (Bright or Maxima)

At those points of the medium where the two interfavores reach in phase, the resultant displacement and hence the resultant intensity the Maximum. These points are called

Maxima and this interference is called Con einterference.

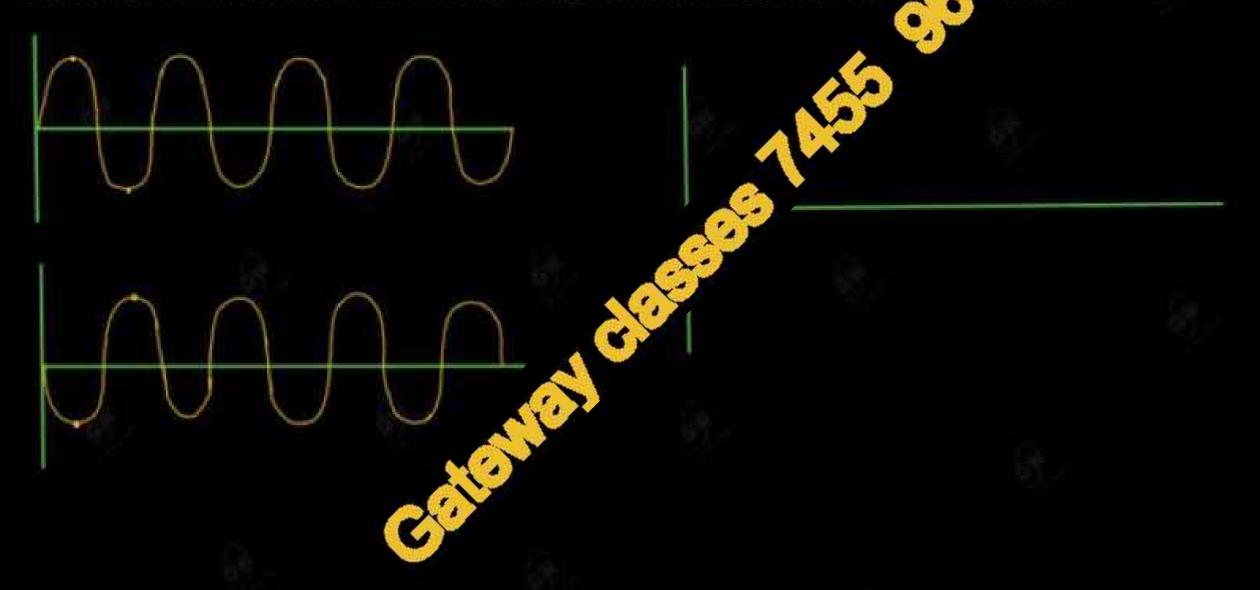

(ii) Destructive interference (Dark or Minima)

At those points of the medium where the two interfering waves reach 'popposite phase, the resultant displacement and hence the resultant intensity become 'm. These points are called Minima and this interference is called Destructive in the land of the points are called Minima and this interference is called Destructive in the land of the la

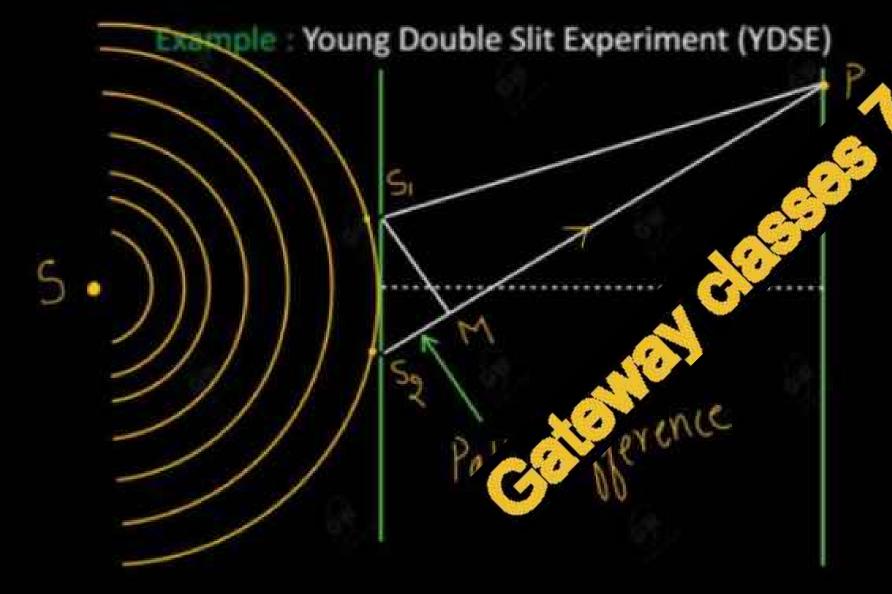

Coherent Sources V. W.E. The sources of light emitting waves of same frequency having zero or constant phase difference are called coherent sources.

re called incoherent sources. The sources of light emitting waves with a random phase differ

Note: For interference Phenomenon, the sources must be

Path Difference = 1 Phase Difference

$$\Delta x = \frac{1}{2\pi} \phi$$

Two independent sources can not produce interference. Why?

Two independent sources of light can not be coherent

Two independent sources of light can not be coherent because independent beams of light do not have constant phase difference. Light is emitted from milling accided atoms or molecules whose vibrations are independent of each other.

Hence, two independent sources of light can not r

interference.

Types of Interference on the basis of source formation

Based on the formation of two Coherent sources, interference are of two types

(i) Division of wave front

Coherent sources are obtained by dividing the wave front, or

Experimental Arrangement

The experimental arrangement to obtain Newton's Rings is shown in figure

Light from a monochromatic source (Sodium light)
S is converted in to parallel beam by a Lens L₂
Which falls on a glass plate G₁ oriented at an angle of 45° with the vertical.

The light reflected by a plate G turns through and is incident normally on the wedge-sh and the formed between the Plano - convex I and the glass plate G.

A microscope M placed above anno - convex

Lens L is used to see the contric dark and

bright Newton's rings

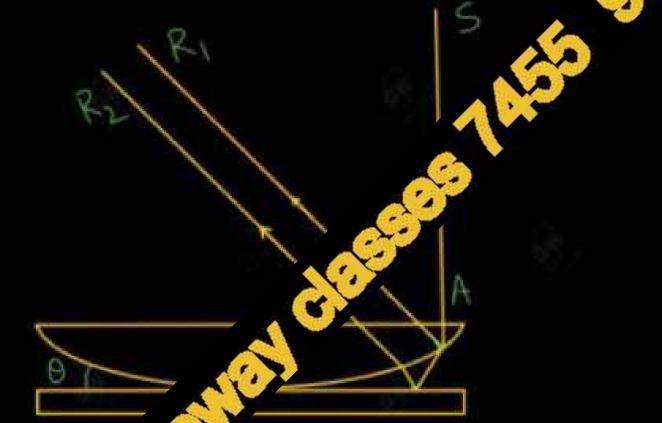

When a Plano-Convex lens of large radius of curvature is placed on a place glass plate, a thin film of air is enclosed between the lower surface (convex surface) of the lens of per surface of the glass plate.

The thickness of air film is zero at the point of contact and it grant increases as we move away from

the point of contact.

If a Monochromatic light is to fall on this air film then alternate Bright and Dark concentric Rings with their Centre Dark are for ned. These rings are known as Newton's Rings.

Newton's rings are formed due to the interference between the waves reflected from the top

surface (R_1) and bottom surface (R_2) of wedge – shaped air film bety n the Plano-Convex lens

and plane glass plate.

Inference theory in Newton's Rings

Path Difference

The path difference between R_1 and R_2 is given

$$\Delta = 2 \mu t \cos (r + \theta) \pm \frac{\lambda}{2}$$

Since, θ is very – very small ($\theta \approx 0$)

$$\Delta = 2 \,\mu t \cos r \pm \frac{\lambda}{r}$$

For normal incidence (r=0)

$$\Delta = 2 \, \mu t \pm \frac{\lambda}{2}$$

For air film $(\mu = 1)$

$$\Delta = 2 t \pm \frac{\lambda}{2}$$

Condition for constructive interference

Condition for destructive interference

(Maxima or Bright Rings)

We know that

$$\Delta = 2 n \left(\frac{\lambda}{2}\right)$$

$$2\mu t \pm \frac{\lambda}{2} = 2 n \frac{\lambda}{2}$$

$$2\mu t = (2 n \pm 1) \frac{\lambda}{2}$$

For air film (μ =1)

$$2t = (2n \pm 1) \frac{\lambda}{2}$$

We know the

$$\Delta = \frac{\lambda}{2} r 1) \frac{\lambda}{2}$$

$$\mu t + \frac{\lambda}{2} = (2n+1)\frac{\lambda}{2} = 2n(\frac{\lambda}{2}) + \frac{\lambda}{2} - \frac{\lambda}{2}$$

$$2\mu t = n\lambda$$

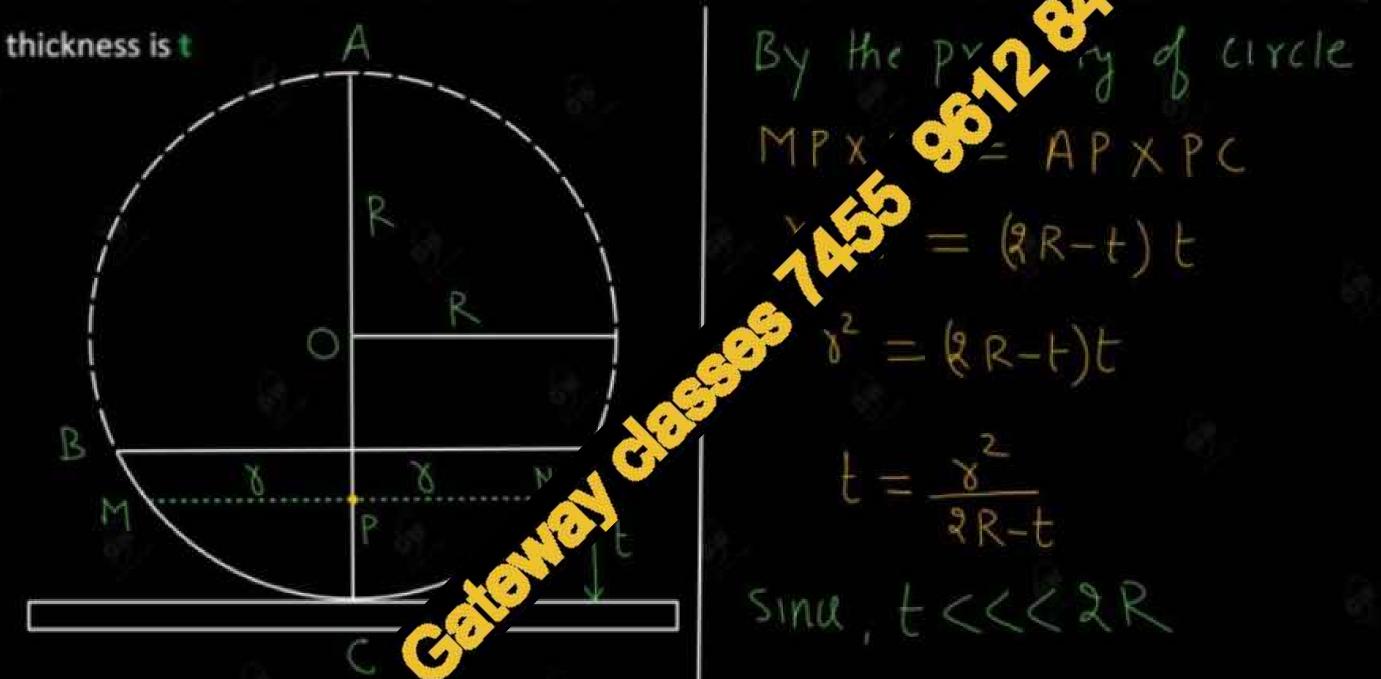

$$2t = n\lambda$$

Expression for diameter of Bright and Dark Newton's Rings.

$$y^2 = (2n - \sqrt{2u})$$

$$\left(\frac{Dn}{2}\right) = (2n-1)\frac{\lambda R}{2M}$$

$$D_n^2 = \frac{2(2n-1)AR}{M}$$

For Air Film (U=1)

$$D_n^2 = 2(2n-1)\lambda R$$

$$D_n = \sqrt{2(2n-1)}AR$$

Dn & Jan-1

Thus Diameter of Bright of is directly proportion to square root odd natural numbers

Diameter of Dark rings

Put the validat in 2ut = nd

For nth ring

$$y_{\eta}^2 = \frac{n \lambda R}{u}$$

For air Film

Thus, Diameter of Davistings is directly proportional to the Quare root of natural number

Centre of Newton's Rings is Dark. Give reason

The wedge – shaped air film is formed between the curved surface of Plan-convex lens and plane glass plate, therefore path difference between interfering rays in refacility in the surface of Plan-convex lens and plane

$$\Delta = 2 \mu t \cos (r + \theta) + \frac{\lambda}{2}$$

At the point of contact (t = 0)

$$\Delta = \frac{\lambda}{2}$$

Which is the condition for minimum intensity

the Centre of Newton's ring is dark

Fringes in Newton's Ring experiment

Fringes in Newton's Ring experit (C) Re circular because the wedge-shaped air film is symmetrical about the point (C) cact of the lens with the plane glass plate and locus of all the points of equal thickness (C) ancentric circles with respect to the point of contact.

Cular Give reason

Application of Newton's Rings Experiment

(i) Determination of Wavelength of Monochromatic light (or sodium light' vising Newton's Ring.

Let $D_n = Diameter of n^{th} Dark Ring$

 $D_{n+p} = Diameter \ of \ (n+p)^{th} \ Dark \ Ring$

We know that

$$D_n^2 = 4n\lambda R - \Box$$

$$D_{n+p}^2 = 4 (n+p) \lambda R$$

$$D_{n+p}^2 = 4n\lambda R + 4p\lambda R$$

Subtract (1) from (2)

$$D_{n+p}^2 - D_n^2 = 4n\lambda R +$$

$$D_{n+p}^2 - D_n^2 = 4p\lambda \lambda$$

$$\lambda = \frac{D_{n+p}^2 - D_n^2}{4 \ pR}$$

Same result will be obtained for bright ring

(ii) Determination of refractive index of a liquid using Newton's Ring.

The transparent liquid whose refractive index is to be determined is intrody detween lens and glass plate.

The diameter of n^{th} dark ring is given by

$$D_n^2 = \frac{4n\,\lambda\,R}{\mu} \qquad ---- \qquad \bigcirc$$

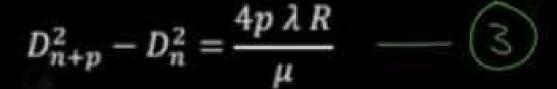

Diameter of $(n+p)^{th}$ dark ring is given by

$$D_{n+p}^2 = \frac{4(n+p)\lambda R}{\mu} \qquad \qquad 2$$

Subtract (1) from (2)

$$D_{n+p}^{2} - D_{n}^{2} = \frac{4(n+p)\lambda R}{\mu} - \frac{4n}{\mu}$$

$$D_{n+p}^{2} - D_{n}^{2} = \frac{4n\lambda R}{\mu}$$

For air $(\mu = 1)$

$$D_{n+p}^2 - D_n^2 = 4p \,\lambda \,R \qquad ---$$

Divide (4) by (3)

$$\mu = \frac{[D_{n+p}^2 - D_n^2]_{air}}{[D_{n+p}^2 - D_n^2]_{liquid}}$$

Thickness of film

OR

$$t = \frac{D^2}{8R}$$

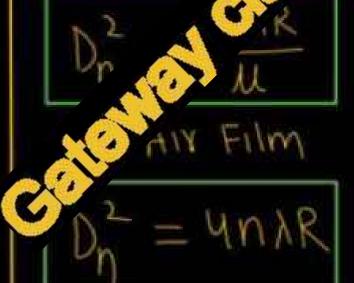

Diameter of Bright Ring

$$D_n^2 = \frac{2(2n-1)\lambda R}{\mu}$$

For Air Film (U=1)

$$D_n^2 = 2(2n-1)/(2n-1)$$

Diameter Jest & sing

Wave ingth (1)

$$\frac{D_{n+P}-D_{n}^{2}}{4PR}$$

Refractive index

$$U = \begin{bmatrix} D_{n+p} - D_n^2 \end{bmatrix}_{119}$$

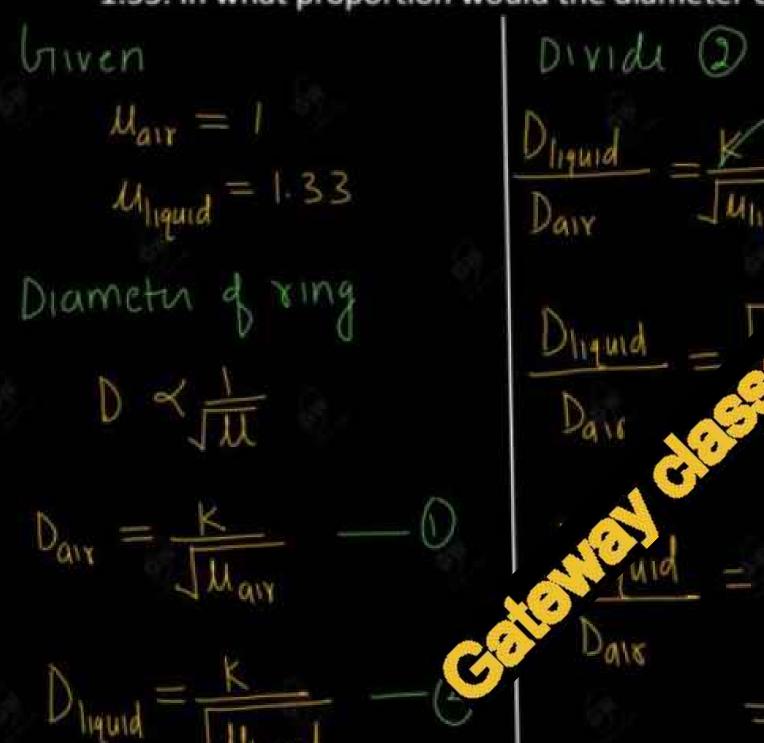

$$\begin{bmatrix} D_{n+p} - D_n^2 \end{bmatrix}_{119}$$

GWQ.1 If in a Newton's ring experiment, the air in the interspace is replaced by a liquid of refractive index

1.33. In what proportion would the diameter of the rings changed.

Q.2 A light source of wavelength 6000 Å is used along with Plano - convex lens with radius of

curvature equal to 100 cm in a Newton's ring arrangement. Find at the diameter of the 15th

dark ring.

We know that

$$\frac{2}{D_n} = \frac{4n1R}{u}$$

$$\frac{2}{D_n} = 4x15 \times 60\%$$

$$\lambda = 6000 \text{ Å}$$
 $D_{15}^2 = 4 \times 15 \times 60\% \frac{30-8}{10 \times 100}$

$$D_{15}^2 = \frac{3}{3} \frac{690}{50} \times 10^{-8} = 0.36$$

$$1\mathring{A} = 10^{-10} \text{ m}$$
 $1\mathring{A} = 10^{-8} \text{ cm}$

. 3 Newton's rings are observed normally in reflected light of wavelength 6000 Å. The diameter

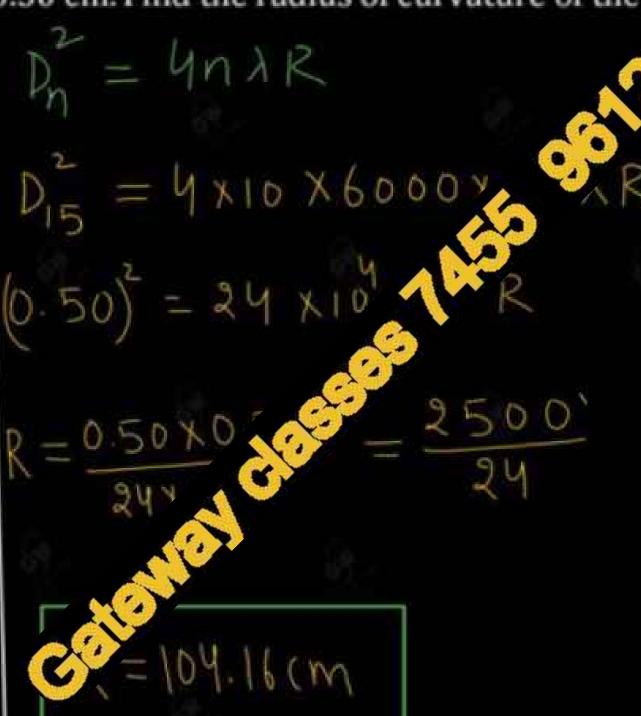

of 10th dark ring is 0.50 cm. Find the radius of curvature of the legand the thickness of the

air film.

$$n = 10$$

$$R = 7$$

$$t = 7$$

$$t = \frac{15}{8R}$$

 $t = (0.50)^{2} \times 24$

Q. 4 In Newton's rings experiment the diameter of 4th and 12th dark ring are 0.400 cm and

0.700 cm respectively. Deduce the diameter of 20th dark ring

$$D_{y} = 0.4 \text{ cm}$$

$$D_{12} = 0.7 \text{ cm}$$

Also
$$D_{20} - D_{3}^{2} = 4 \times 10^{3} \text{ A}$$

$$D_{1} \times 10^{2} - D_{3} \times 10^{3} \text{ A}$$

$$D_{20} - D_{3} = 4 \times 10^{3} \text{ A}$$

$$D_{20} - D_{3} = 4 \times 10^{3} \text{ A}$$

$$D_{20} - D_{3} = 4 \times 10^{3} \text{ A}$$

$$D_{20} - D_{3} = 4 \times 10^{3} \text{ A}$$

$$D_{20} - D_{3} = 2$$

$$D_{20} - D_{3} = 2$$

$$D_{10}^{2} - D_{3}^{2} = 2$$

$$D_{20}^{2} = 2D_{12}^{2} D_{4}^{2}$$

$$D_{20}^{2} = 2(0.7)^{2} - (0.4)^{2}$$

$$D_{20}^{2} = 0.98 - 0.16$$

= 0.906cm

Q. 5 Newton's rings are observed by keeping a spherical surface of 100 cm radius on a plane

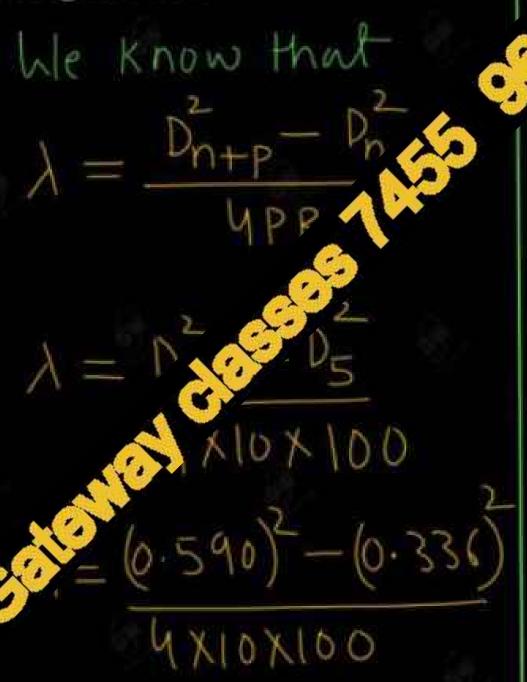

glass plate. If the diameter of 15th bright ring is 0.590 cm and dia eter of 5th ring 0.336 cm.

What is the wavelength of light used?

$$L_{100}$$
 R = 100 cm

 $D_{15} = 0.590$ cm

 $D_{15} = 0.336$ cm

6 Newton's rings are formed in reflected light of wavelength 6000 Å with a liquid between

the plane and curved surface. If the diameter of 6th bright ring is 1 mm and the radius of curvature of the curved surface is 100 cm, calcutate the refr.

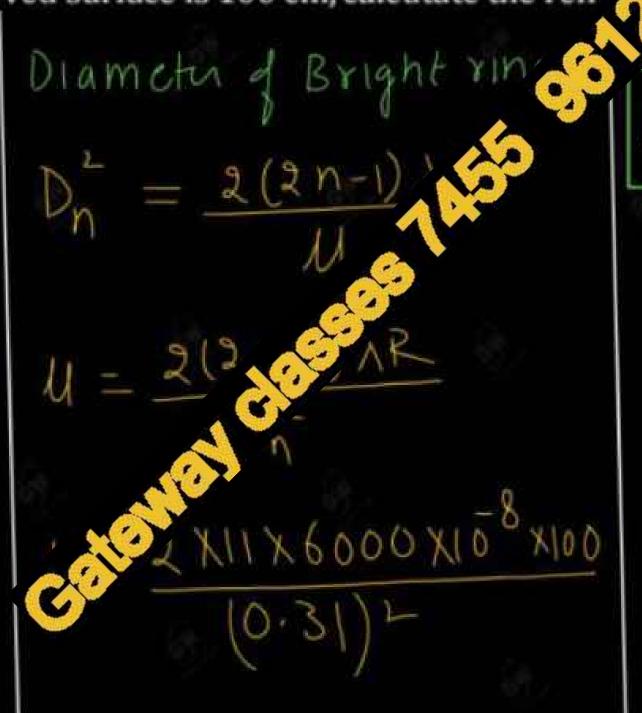

$$\frac{6000\text{ Å}}{\lambda = 6000\text{ Å}}$$

$$D_6 = 3.1\text{mm}$$

$$= 0.31\text{m}$$

$$R = 100\text{m}$$

$$1 = 6$$

Engineering Physics (By Gulshan Sir)

ed monochromatic light. Deduce the

DPP-4

UNIT: Wave Optics

- Q.1 Why the center of Newton's ring in reflected system is dark?
- Q.2 Describe and explain the formation of Newton's rings in necessary expression for bright and dark rings.
- Q.3 Discuss the formation of Newton's rings. Show ' diameters of the bright rings are proportional to the square root of odd nat mbers.
- Q. 4 Describe the formation of Newton's riv onochromatic light. Show that in reflected light, the diameters of dark rings are proport on the square roots of natural numbers.
- 0.5 Describe how Newton's ring event can be used to determine the wavelength of light
- Q.6 Describe how Newton's river riment can be used to determine the refractive index of a liquid.
