

### **Presentation Objectives**

- ✓ Introduction To Compensatory Mitigation and the 2008 Mitigation Rule
- ✓ Compensatory Mitigation Hierarchy
- ✓ Functional Assessments
- ✓ How To Find Mitigation Bank Credits
- ✓ The Proximity Factor Tool
- ✓ Permittee Responsible Mitigation and Mitigation Plan Components
- ✓ Advanced Permittee Responsible Mitigation Sites (APRMS)

### What is Compensatory Mitigation?

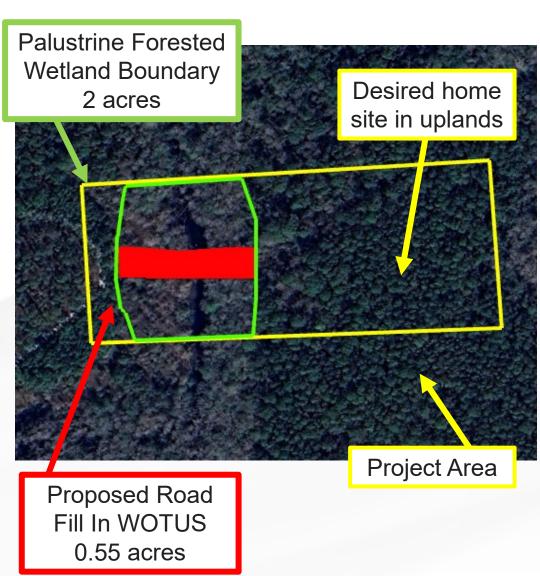

**33 CFR 332.2** "Compensatory mitigation" means the restoration (re-establishment or rehabilitation), establishment (creation), enhancement, and/or in certain circumstances preservation of aquatic resources for the purposes of offsetting unavoidable adverse impacts which remain after all appropriate and practicable avoidance and minimization has been achieved.

The Corps said there are jurisdictional Waters of the U.S. (WOTUS) on my property, and I need a Department of the Army (DA) permit.

Do I also need mitigation to put a driveway through WOTUS to access my uplands and build a house...maybe...

### Introduction to Compensatory Mitigation

#### **SEQUENCE**

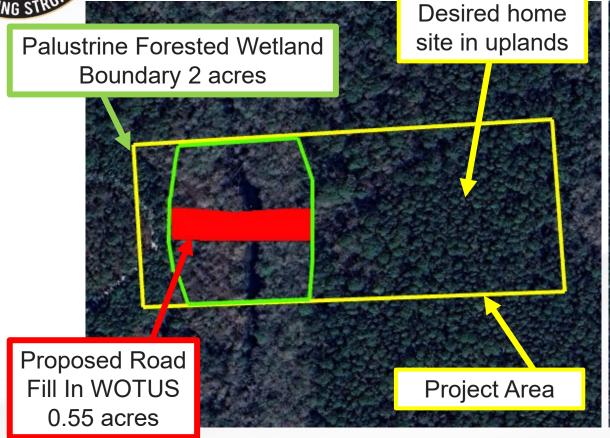

- Replace lost functions/services.
- Must be related to project impacts.
- Corps determines the adequacy of type and amount of compensatory mitigation proposed by applicant.
- May be required to meet 404(b)(1) Guidelines or as a result of a public interest review (reduces the overall project impacts to less than significant).

# 250 YEARS 1775 2025 BUILDING STRONG

### What is Compensatory Mitigation?

Avoid

Minimize

### When is Compensatory Mitigation Required?

#### Nationwide Permits: 0.1-acre wetland loss threshold

- > GREATER THAN 0.1 acres, unless no more than minimal adverse effects w/ Activity Specific Waiver.
- LESS THAN 0.1 acres, if needed to ensure only minimal adverse effects.

#### Nationwide Permits: 0.03 acres stream loss threshold

- GREATER THAN 0.03 acres, unless no more than minimal adverse effects w/ Activity Specific Waiver
- LESS THAN 0.03 acres, if needed to ensure only minimal adverse effects:

**Individual Permit:** Required for impacts ≥0.50 acre in freshwater wetlands

### **Mitigation Option Differences**

| Mitigation<br>Type | Responsible<br>Party  | When Mitigation Type Can Be Considered For Compensatory Mitigation   | Are Credit<br>Sales<br>Allowed | Who Can<br>Use As<br>Mitigation  | Instrument<br>Required | Credit<br>Releases | Service<br>Area |
|--------------------|---|--|--------------------------------|--|------------------------|--------------------|-----------------|
| Mitigation<br>Bank | Mitigation Bank Sponsor as identified in the Mitigation Banking Instrument (MBI). | Credits must be available prior to impacts.  | Yes                            | Permittees as approved by the permitting agency consistent with the provisions of the permit and MBI.                        | Yes                    | Yes                | Yes             |
| ILF                | ILF Program<br>Sponsor as<br>identified in<br>the ILF<br>program<br>instrument.   | Credits must be available prior to impacts.  | Yes                            | Permittees as approved by the permitting agency consistent with the provisions of the permit and the ILF program instrument. | Yes                    | Yes                | Yes             |
| PRM                | Permittee   | Mitigation effort<br>must be<br>implemented in<br>advance (i.e.,<br>APRMS Project)<br>or concurrently<br>with impacts. | No                             | Permittee<br>responsible<br>for PRM site.  | No                     | No                 | No              |

### **Mitigation Hierarchy**

The Mitigation Rule establishes the following preferential hierarchy for the type and location of compensatory mitigation (mitigation hierarchy) in 33 CFR § 332.3(b).

- 1. Mitigation Bank Credits: 33 CFR § 332.3 (b)(2)
- 2. ILF Program Credits: 33 CFR § 332.3 (b)(3)
- 3. Permittee Responsible Mitigation (PRM) under Watershed Approach: 33 CFR § 332.3 (b)(4)
- 4. PRM On-Site and In-Kind: 33 CFR § 332.3 (b)(5)
- 5. PRM Off-Site and/or Out-of-Kind: 33 CFR § 332.3 (b)(6)

### **How many Mitigation Credits do I need?**

### Determination of Credits 33 CFR 332.4(c)(6) Perform A Functional Assessment

- Used to evaluate the physical, chemical, and biological processes that occur in ecosystems.
- Determines baseline score for existing conditions and post project/post mitigation conditions.
- Generates values (currency) for functional gain (mitigation) and functional loss (impacts to WOTUS).

#### **Functional Assessment Methods Used in Florida:**

- Uniform Mitigation Assessment Method (UMAM). Primary in Florida
- Wetland Benefit Index (Developed by Broward County, FL)
- Wetland Assessment Technique for Environmental Review (WATER)
- Wetland Rapid Assessment Procedure (WRAP)
- Modified Wetland Rapid Assessment Procedure (M-WRAP)
- Estuarine Wetland Rapid Assessment Procedure (E-WRAP)
- Hydrogeomorphic Approach (HGM)
- Little Pine Island (LPI)

The functional assessment methodology that is used for the impact site and mitigation site must be the same in order for an "apples to apples" comparison.

#### **UMAM Overview**

Adopted from Chapter 62-345, Florida Administrative Code (FAC)

https://www.flrules.org/gateway/ChapterHome.asp?Chapter=62-345

### Two-part methodology used to assess Functional Loss and Functional Gain.

- Part 1: Qualitative
- Part 2: Quantitative

Provide whole number scores (0-10):

- 1. Location, Landscape, and Support
- 2. Water Environment
- 3. Community structure

#### UMAM Scoring Worksheet ~ Community Structure: Terrestrial

| Community Structure   | Optimal (10)   | Moderate (7)   | Minimal (4)  | Not Present (0)   |
|---|--|--|--|---|
| 1. Vegetation and Structural<br>Habitat   | vegetation community and<br>physical structure provide<br>conditions which support an<br>optimal level of function to<br>benefit fish and wildlife | vegetation community and<br>physical structure limited to<br>70% of optimal level of<br>function to benefit fish and<br>wildlife in Part I | vegetation community and<br>physical structure limited to<br>40% of optimal level of<br>function to benefit fish and<br>wildlife in Part I | vegetation community and<br>physical structure do not<br>provide function to benefit<br>fish and wildlife in Part I       |
| I. Plant species in the canopy, shrub, or ground stratum  | all or nearly all appropriate and<br>desirable   | majority appropriate and<br>desirable  | majority inappropriate or<br>undesirable   | no appropriate or desirable species   |
| II. Invasive exotics or other invasive plant species  | not present  | present, but cover is minimal  | majority of plant cover  | high presence and cover   |
| III. Regeneration & recruitment   | normal and natural   | near-normal  | minimal evidence   | no evidence   |
| IV. Age & size distribution   | typical of type of system with<br>no deviation from normal<br>patterns of succession or<br>mortality   | no indication of permanent<br>deviation, but may have had<br>temporary deviations or<br>impacts to age and size<br>distribution            | atypical and indicative of<br>permanent deviation from<br>normal successional pattern,<br>with greater than expected<br>mortality          | high percentage of dead and<br>dying vegetation, with no<br>typical age and size<br>distribution                          |
| V. Density and quality of coarse woody<br>debris, snag, den, and cavity   | optimal structural habitat   | slightly lower or slightly<br>greater than normal quantity   | not present or greater than<br>normal because vegetation is<br>dead or dying   | not present or exist only<br>because native vegetation is<br>dead or dying  |
| VI. Plant condition   | good condition, with very little<br>to no evidence of chlorotic or<br>spindly growth or insect<br>damage   | generally good, with little<br>evidence of chlorotic or<br>spindly growth or insect<br>damage  | generally poor, with evidence<br>of chlorotic or spindly<br>growth or insect damage  | overall very poor, with<br>strong evidence of chlorotic<br>or spindly growth or insect<br>damage                          |
| VII. Land management practices  | optimal for long term viability<br>of plant community  | generally appropriate some<br>possible fire suppression or<br>water control features that<br>have caused a shift in plant<br>community     | partial removal or alteration<br>of natural structure, or<br>introduction or artificial<br>features, such as furrow or<br>ditches          | removal or alteration of<br>natural structure, or<br>introduction or artificial<br>features, such as furrow or<br>ditches |
| VIII. Topographic features such as refugia<br>ponds, creek channels, flats or hummocks  | present and normal   | slightly less than optimal   | reduction in extent of<br>topographic features from<br>what is normal  | lack of topographic features<br>that are normal for the area<br>being assessed  |
| IX. Siltation or algal growth in submerged aquatic plant communities  | no evidence  | minor degree of siltation or<br>algal growth   | moderate degree of siltation or algal growth   | high degree of siltation or<br>algal growth   |
| X. Upland mitigation area - level of habitat<br>and support for fish and wildlife in the<br>associated wetlands or surface waters | optimal level of habitat and life<br>history support   | high, but less than optimal<br>level of habitat and life<br>history support  | moderate level of habitat and<br>life history support  | little or no habitat and life<br>history support  |

#### UMAM Scoring Worksheet ~ Water Environment

|   | Optimal (10)  | Moderate (7)   | Minimal (4)  | Not Present (0)   |
|---|---|--|--|---|
| Water Environment   | hydrology and water quality fully<br>supports functions and provides<br>benefits to fish and wildlife at optimal<br>capacity  | hydrology and water quality<br>supports functions and provides<br>benefits at 70% of optimal<br>capacity   | hydrology and water quality supports<br>functions and provides benefits at<br>40% of optimal capacity  | hydrology and water quality does not<br>support functions and provides no<br>benefits to fish and wildlife  |
| a. Water levels and flows   | appropriate   | slightly higher or lower than appropriate  | moderately higher or lower than appropriate  | extreme degree of deviation   |
| b. Water level indicators   | distinct and consistent with expected   | not as distinct or as consistent as expected   | not distinct and not consistent with expected  | not present or greatly inconsistent with expected hydrologic conditions   |
| c. Soil moisture  | appropriate with no evidence of soil<br>desiccation, oxidation or subsidence  | minimal soil oxidation or<br>subsidence; soils are drier than<br>expected  | strong evidence of soil desiccation,<br>oxidation or subsidence  | strong evidence of substantial soil<br>desiccation, oxidation or subsidence   |
| d. Soil erosion or deposition   | not atypical or indicative of altered<br>flow rates   | minor alteration in flow rates or<br>points of discharge   | atypical and indicative of alterations in flow rates or points of discharge  | greatly atypical and indicative of greatly<br>altered flow rates or points of discharge   |
| e. Evidence of fire history   | not atypical frequency or severity due<br>to excessive dryness  | fire frequency or severity may be<br>more than expected  | frequency or severity much more<br>than expected, possibly due to<br>dryness   | great deviation from typical, due to<br>extreme dryness   |
| f. Vegetation - community zonation  | appropriate in all strata   | inappropriate in some strata   | inappropriate in most strata   | inappropriate in all strata   |
| g. Vegetation – hydrologic stress   | no signs of hydrologic stress such as<br>excessive mortality, leaning or fallen<br>tress, thinning canopy, insect damage<br>or disease associated with hydrologic<br>stress | slightly greater than normal<br>mortality, leaning or fallen tress,<br>thinning canopy, or signs of<br>insect damage or disease<br>associated with hydrologic stress | strong evidence of greater than<br>normal mortality, leaning or fallen<br>tress, thinning canopy, or signs of<br>insect damage or disease associated<br>with hydrologic stress | strong evidence of much greater than<br>normal mortality, leaning or fallen tress<br>thinning of canopy, or signs of insect<br>damage or disease associated with<br>hydrologic stress |
| h. Use by animal species with specific<br>hydrological requirements   | consistent with expected hydrological conditions  | less than expected   | greatly reduced  | lacking   |
| i. Plant community composition – species<br>tolerant of and associated with water<br>quality degradation or flow alteration | Plant community composition is not<br>characterized by species tolerant of<br>and associated with water quality<br>degradation or flow alteration                           | some species tolerant of and<br>associated with water quality<br>degradation or flow alteration  | much of the community consists of<br>species tolerant of and associated<br>with water quality degradation or<br>flow alteration  | community consists predominantly of<br>species tolerant of and associated with<br>water quality degradation or flow<br>alteration   |
| j. Direct observation of standing water   | no water quality degradation such as<br>discoloration, turbidity, or oil sheen  | slight water quality degradation<br>such as discoloration, turbidity,<br>or oil sheen  | moderate water quality degradation<br>such as discoloration, turbidity, or oil<br>sheen  | significant water quality degradation<br>such as obvious discoloration, turbidity<br>or oil sheen   |
| k. Existing water quality data  | conditions are optimal for community type   | slight deviation from normal,<br>with minimal ecological effects   | moderate deviation from normal,<br>with expected ecological effects  | large deviation from normal, with expected adverse ecological effects   |
| Water depth, wave energy, currents and<br>light penetration   | optimal for community type  | generally sufficient but expected<br>to cause some changes in species,<br>age classes and densities  | not well suited for and expected to<br>cause significant changes in species,<br>age classes and densities  | inappropriate for community type  |

#### UMAM Scoring Worksheet ~ Location and Landscape Support

<u>Guidance:</u> This worksheet is only a summary and is not intended to replace the rule. The rule should be used to resolve any question or dispute.

|  | Optimal (10)  | Moderate (7)  | Minimal (4)  | Not Present (0)   |
|--|---|---|--|---|
| Location and Landscape Support   | full opportunity to perform<br>beneficial functions at<br>optimal level         | opportunity to perform<br>beneficial functions is<br>limited to 70% of optimal<br>ecological value                              | opportunity to perform<br>beneficial functions is<br>limited to 40% of optimal<br>ecological value                           | provides no habitat support<br>or opportunity to provide<br>benefits to fish and wildlife                   |
| a. Support to wildlife by outside habitats   | full range of habitats needed<br>to support all wildlife<br>species             | optimal support for most,<br>but not all wildlife species   | fail to provide support for<br>some, or minimal support<br>for many wildlife species   | no habitat support for<br>wildlife  |
| b. Invasive exotics or other invasive plant<br>species in proximity of the assessment area | not present   | present but cover is minimal<br>and has minimal adverse<br>effects  | majority of plant cover<br>consists of invasive exotics<br>that adversely affect<br>functions                                | predominance of plant<br>cover consists of invasive<br>exotics so that little or no<br>function is provided |
| c. Wildlife access to and from outside – distance<br>and barriers                          | not limited by distance or<br>barriers  | partially limited by distance or barriers   | substantially limited by<br>distance or barriers   | precluded by distance or<br>barriers  |
| d. Functions that benefit fish & wildlife<br>downstream – distance or barriers             | not limited by distance or<br>barriers  | somewhat limited by<br>distance or barriers that<br>reduce opportunity to<br>provide benefits                                   | limited by distance or<br>barriers that substantially<br>reduce opportunity to<br>provide benefits                           | functions not present   |
| e. Impacts of land uses outside assessment area to fish and wildlife                       | no adverse impacts on<br>wildlife   | minimal adverse impacts on wildlife   | significant adverse impacts<br>on wildlife   | severe adverse impacts on wildlife  |
| f Benefits to downstream or other<br>hydrologically connected areas                        | opportunity is not limited by<br>hydrologic impediments or<br>flow restrictions | limited by hydrologic<br>impediments or flow<br>restrictions so that benefits<br>are provided with lesser<br>freq. or magnitude | limited by hydrologic<br>impediments so that benefits<br>are rarely provided or are<br>provided at greatly reduced<br>levels | no opportunity to provide<br>benefits due to hydrologic<br>impediments or flow<br>restrictions              |
| g. | <b>Assessment Area</b> | Impact Type                | FLUCCS (3 digits) / FLCCS (4 or more digits) | Without                  | With | Without       | With | Without       | With | Delta | Acreage | Loss Units |
| Wetland 1              | Permanent - Dredge or Fill | 22331 - Bottomland Forest Wetlands           | 8                        | 0    | 8             | 0    | 7             | 0    | -0.77 | 0.23    | -0.18      |

The proposed impact to 0.23 acres of bottomland forested wetlands would result in 0.18 units of functional loss.

The applicant would be required to either purchase 0.18 palustrine forested credits OR if credits are not available develop a permittee-responsible mitigation plan that would generate at least 0.18 units of functional gain.

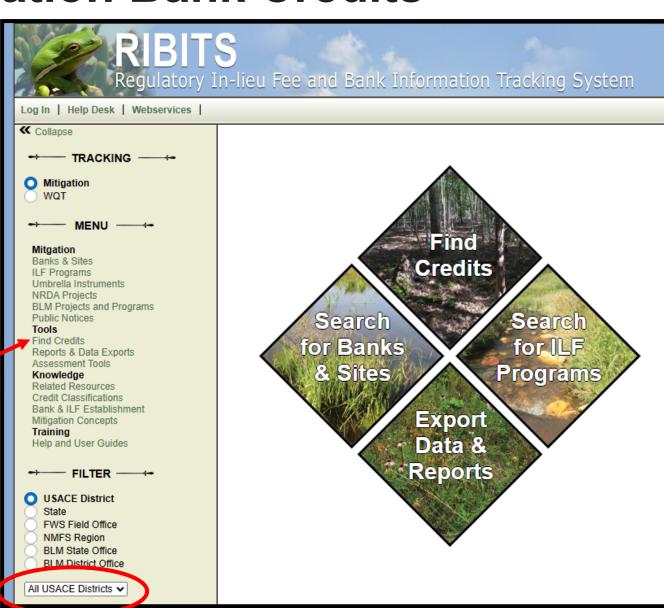

### **0.18 Palustrine Forested Credits** needed to satisfy permit requirements

- Regulatory In-Lieu Fee Bank Information Tracking System (RIBITS) <a href="https://ribits.ops.usace.army.mil">https://ribits.ops.usace.army.mil</a>
- Select Jacksonville District From Dropdown Menu
- 3) Click "Find Credits" Under "Tools" header.

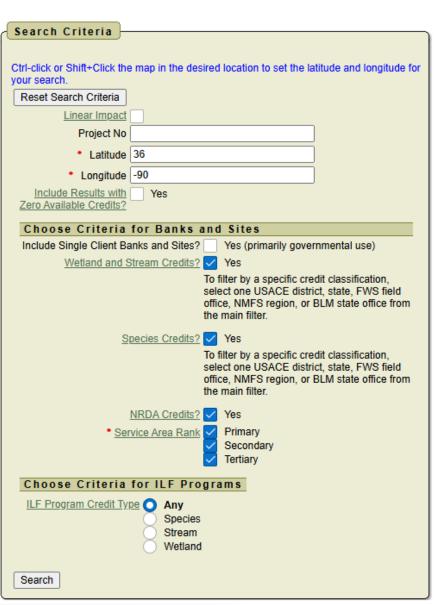

- 1) Enter coordinates of impact site in decimal degrees.
- 2) Check "Wetland and Stream" credits for Section 404 impacts to WOTUS.
- 3) For species credits to satisfy ESA/USFWS requirements, check "Species Credits." Please note at this time there are no joint 404/Species banks in Florida.
- Jacksonville District only has Primary service areas but recommend checking all three options.
- 5) Check option for ILF credit type desired.
- 6) Click search!

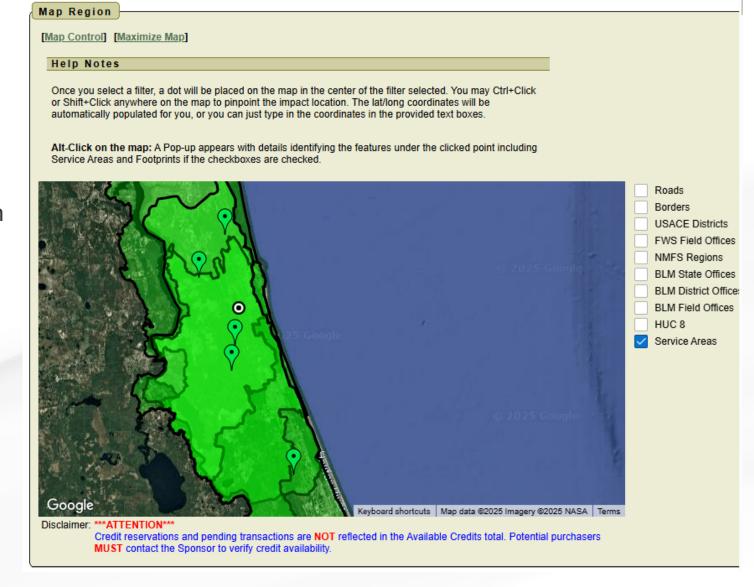

- The search will depict the banks or ILF sites with service areas covering the impact site.
- Hovering over each pin will identify the bank which then can be searched under the "Mitigation" and "Banks & Sites" tab.
- This search reveals 5
  banks have a service area
  covering the impact site.

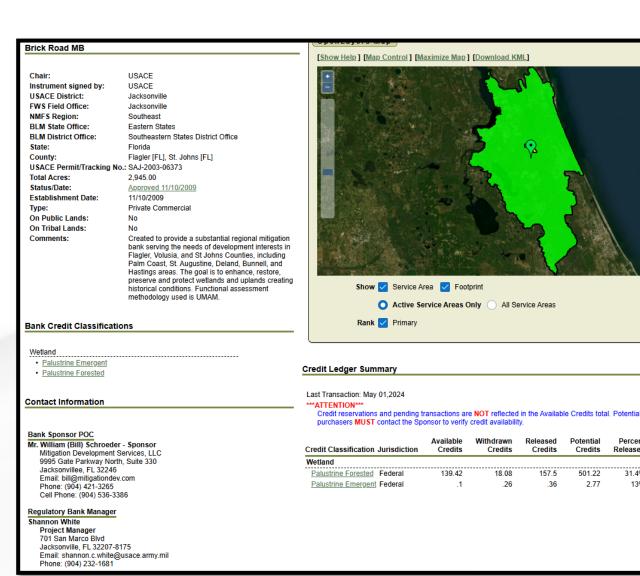

- Depicts status (approved/suspended) and available credit types.
- Identified current status (approved or suspended)
- Depicts date approved (Established Date)
- Lists the bank Sponsor.
- Identifies the Corps PM.
- Depicts the functional assessment utilized at the bank in the Comments section
- "Trick the system" to look for outside of service area options by entering coordinates further away.

Does this mitigation bank have the 0.18 Palustrine Forested credits that I need...maybe?

#### Credit Ledger Summary

Last Transaction: May 01,2024

#### \*\*\*ATTENTION\*\*\*

Credit reservations and pending transactions are **NOT** reflected in the Available Credits total. Potential purchasers **MUST** contact the Sponsor to verify credit availability.

| Credit Classification Jurisdiction | Available<br>Credits | Withdrawn<br>Credits | Released<br>Credits | Potential<br>Credits | Percent<br>Released |
|------------------------------------|----------------------|----------------------|---------------------|----------------------|---------------------|
| Wetland                            |                      |                      |                     |                      |                     |
| Palustrine Forested Federal        | 139.42               | 18.08                | 157.5               | 501.22               | 31.4%               |
| Palustrine Emergent Federal        | .1                   | .26                  | .36                 | 2.77                 | 13%                 |

Please note that the available credits may not be accurate for a variety of reasons, and it is recommended to reach out to the Bank Sponsor or credit sales POC as the Corps does not track credits that may be reserved by the Sponsor for a particular project.

#### What if no credits are available?

#### **SAJ Proximity Factor Tool**:

Provides additional mitigation options to the entire State of Florida

- Approved for Use: March 30, 2023, and updated for clarity on October 4, 2024. Public notice and tool located on Jacksonville District Source Book webpage.
- Consistent method for determining amount of compensatory mitigation proposed
  - 1) outside approved MB and ILF Program/Site service areas (OSA) or
  - 2) outside impact 8-digit HUC watersheds for PRM
- Based on ratio multipliers for multiple variables.
- Variables Considered:
  - 8-digit HUCs relative to the impact and compensatory mitigation sites.
  - In-kind versus out-of-kind replacement.
  - EPA Level 4 Ecoregions

### **Proximity Factor Tool**

| Proximity Factor Calculation Table   | Variables |
|--|-----------|
| If the impact site is outside of a mitigation bank/ILF service area boundary, but within the same 8-digit HUC that contains the mitigation bank location/ILF service area boundary, enter 1. For PRM, if the impact site is located within the same 8-digit HUC that contains the PRM site, enter 1. If the impact site is located outside the 8-digit HUC that contains the mitigation bank/ILF service area boundary or PRM site, enter 0 and proceed to the next row. | 0         |
| If the impact site is outside of a mitigation bank/ILF service area boundary and one 8-digit HUC away from the mitigation bank location/ILF service area boundary, enter 1.5. For PRM, if the impact site is located one 8-digit HUC away from the proposed PRM site, enter 1.5.   |           |
| For each additional 8-digit HUC away from the mitigation bank, ILF service area boundary, or PRM site, add 0.25. If not applicable, enter 0.   |           |
| If the mitigation entails in-kind replacement of impacted WOTUS, enter 0. For out-of-kind replacement of impacted WOTUS, enter 0.75.   |           |
| If the mitigation occurs within the same EPA Level IV Ecoregion, enter 0. If the mitigation occurs within a different EPA Level IV Ecoregion, enter 0.25.  |           |
| Proximity Factor Multiplier:   |           |

### **Proximity Factor Example**

| Proximity Factor Calculation Table   | Variables |
|--|-----------|
| If the impact site is outside of a mitigation bank/ILF service area boundary, but within the same 8-digit HUC that contains the mitigation bank location/ILF service area boundary, enter 1. For PRM, if the impact site is located within the same 8-digit HUC that contains the PRM site, enter 1. If the impact site is located outside the 8-digit HUC that contains the mitigation bank/ILF service area boundary or PRM site, enter 0 and proceed to the next row. | 0         |
| If the impact site is outside of a mitigation bank/ILF service area boundary and one 8-digit HUC away from the mitigation bank location/ILF service area boundary, enter 1.5. For PRM, if the impact site is located one 8-digit HUC away from the proposed PRM site, enter 1.5.   | 1.50      |
| For each additional 8-digit HUC away from the mitigation bank, ILF service area boundary, or PRM site, add 0.25. If not applicable, enter 0.   | 0         |
| If the mitigation entails in-kind replacement of impacted WOTUS, enter 0. For out-of-kind replacement of impacted WOTUS, enter 0.75.   | 0         |
| If the mitigation occurs within the same EPA Level IV Ecoregion, enter 0. If the mitigation occurs within a different EPA Level IV Ecoregion, enter 0.25.  | 0         |
| Proximity Factor Multiplier:   | 1.5       |

### **Proximity Factor Example**

| Proximity Factor Multiplier:   | 1.75      |

Bank

### **Proximity Factor Tool**

- MB or ILF Instrument must allow for OSA consideration.
- Out of the 100 approved mitigation banks, 42 currently identified with provisions in the MBI that allow for credit sales for OSA impacts.
- List of banks approved for OSA on a case-by-case basis is located on RIBITS under "Bank and In-Lieu Fee Establishment" tab. It is updated regularly, but it is recommended to contact the bank PM or Sponsor if not on list.
- The proximity factor tool does not supersede the Corps' considerations of compensatory mitigation options in the order presented in 33 CFR 332.3(b)(2) through (b)(6).

## What if PRM Is the environmentally preferrable option?

The four types of compensatory mitigation are:

- **1. Restoration** divided into two categories:
  - Re-establishment (gain in aquatic resource area and functions)
  - Rehabilitation (gain in functions only)
- 2. Enhancement (gain in selected aquatic resource function/s, may cause decline in other functions)
- 3. Establishment (creation, gain in aquatic resource area and functions)
- 4. Preservation (no gain in aquatic resource area or functions)

### When does mitigation need to be finalized?

CFR 332.3(k)
Individual Permit Mitigation Requirements

- Mitigation plan must be finalized and approved along with permit.
- If using a mitigation bank or ILF program, the number/type of credits and specific bank need to be identified in permit.

#### Nationwide Permit Mitigation Requirements

- Permit must describe the compensatory mitigation proposal, which may be either conceptual or detailed. However, construction may not begin until mitigation plan is approved by the Corps.
- If using a mitigation bank or ILF program, the number/type of credits must be identified in the permit.

### Mitigation Plan Components - 33 CFR 332.4(c)

Objectives
 Maintenance Plan

Site Selection
 Performance Standards

3. Site Protection Instrument 9. Monitoring Requirements

4. Baseline Information 10. Long-Term Management Plan

5. Determination of Credits 11. Adaptive Management Plan

6. Mitigation Work Plan 12. Financial Assurances

#### **Objectives 33 CFR 332.4(c)(2)**

A description of the resource type(s) and amount(s) that will be provided, the method of compensation (i.e., restoration, establishment, enhancement, and/or preservation), and the manner in which the resource functions of the compensatory mitigation project will address the needs of the watershed, ecoregion, physiographic province, or other geographic area of interest.

#### **Example:**

Re-establishment of XXX acres of drained Wet Flatwoods (FNAI) through filling of on-site ditches, raising the invert of two culverts, removal of Florida Invasive Species Council (FISC) Category I&II Invasive/Exotic species, thinning of planted pines, and return of prescribed fire to the existing upland Coniferous Plantation (FLCCS 183332) to result in XXX acres of Wet Flatwoods identified as assessment area W2.

#### Site Selection 33 CFR 332.4(c)(3)

A description of the factors considered during the site selection process. This should include consideration of watershed needs, on-site alternatives where applicable, and the practicability of accomplishing ecologically self-sustaining aquatic resource restoration, establishment, enhancement, and/or preservation at the compensatory mitigation project site.

#### Site Protection Instrument 33 CFR 332.4(c)(4)

A description of the legal arrangements and instrument, including site ownership, that will be used to ensure the long-term protection of the compensatory mitigation project site.

Conservation easements are primary form of site protection for mitigation projects in Florida.

**Baseline Information** 33 CFR 332.4(c)(5)

A description of the ecological characteristics of the proposed compensatory mitigation project site and, in the case of an application for a DA permit, the impact site. This may include descriptions of historic and existing plant communities, historic and existing hydrology, soil conditions, a map showing the locations of the impact and mitigation site(s) or the geographic coordinates for those site(s), and other site characteristics appropriate to the type of resource proposed as compensation. The baseline information should also include a delineation of WOTUS on the proposed compensatory mitigation project site.

Please note that proposed re-establishment of hydrology or wetland establishment is likely to require installation of monitoring wells and water table monitoring to establish the baseline hydroperiod.

#### **Determination of Credits 33 CFR 332.4(c)(6)**

A description of the number of credits to be provided, including a brief explanation of the rationale for this determination.

- For PRM, this should include an explanation of how the compensatory mitigation project will
  provide the required compensation for unavoidable impacts to aquatic resources resulting
  from the permitted activity.
- For permittees intending to secure credits from an approved mitigation bank or in-lieu fee
  program, it should include the number and resource type of credits to be secured and how
  these were determined.

Mitigation Work Plan 33 CFR 332.4(c)(7)

Detailed written specifications and work descriptions for the compensatory mitigation project, including, but not limited to, the geographic boundaries of the project; construction methods, timing, and sequence; source(s) of water, including connections to existing waters and uplands; methods for establishing the desired plant community; plans to control invasive plant species; the proposed grading plan, including elevations and slopes of the substrate; soil management; and erosion control measures. For stream compensatory mitigation projects, the mitigation work plan may also include other relevant information, such as planform geometry, channel form (e.g., typical channel cross-sections), watershed size, design discharge, and riparian area plantings.

#### Maintenance Plan 33 CFR 332.4(c)(8)

A description and schedule of maintenance requirements to ensure the continued viability of the resource once initial construction is completed. These are the activities to occur between construction and long-term management.

#### **Performance Standards** 33 CFR 332.4(c)(9)

Ecologically-based standards that will be used to determine whether the compensatory mitigation project is achieving its objective.

**33 CFR 332.5(a) -** Performance standards should relate to the objectives of the compensatory mitigation project, so that the project can be objectively evaluated to determine if it is developing into the desired resource type, providing the expected functions, and attaining any other applicable metrics.

**33 CFR 332.5(b) -** Performance standards must be based on attributes that are objective and verifiable. Ecological performance standards must be based on the best available science that can be measured or assessed in a practicable manner...

#### **Monitoring Requirements** 33 CFR 332.4(c)(10)

A description of parameters to be monitored in order to determine if the compensatory mitigation project is on track to meet performance standards and if adaptive management is needed. A schedule for monitoring and reporting on monitoring results to the district engineer must be included.

#### Long-Term Management Plan 33 CFR 332.4(c)(11)

A description of how the compensatory mitigation project will be managed after performance standards have been achieved to ensure the long-term sustainability of the resource, including long-term financing mechanisms and the party responsible for long-term management.

Templates approved for use by the State of Florida and the Corps for long-term financing options for mitigation banks along with example cost estimate spreadsheet are located on RIBITS. These are good foundations for use and can be edited to remove reference to mitigation banks for a PRM project or reach out to project manager for PRM templates.

#### **Adaptive Management Plan** 33 CFR 332.4(c)(12)

A management strategy to address unforeseen changes in site conditions or other components of the compensatory mitigation project, including the party or parties responsible for implementing adaptive management measures. The adaptive management plan will guide decisions for revising compensatory mitigation plans and implementing measures to address both foreseeable and unforeseen circumstances that adversely affect compensatory mitigation success.

#### Financial Assurances 33 CFR 332.4(c)(13)

A description of financial assurances that will be provided and how they are sufficient to ensure a high level of confidence that the compensatory mitigation project will be successfully completed, in accordance with its performance standards.

Financial assurances need to include costs for construction as well as the implementation activities described for Maintenance.

### **UMAM Corps and State Time Lag Differences**

| >55   | 3.91  |  |  |  |  |  |  |

#### **UMAM Risk Factor**

- ✓ Risk Factor Values Range from 0 (no risk) to 3 (high risk)
- ✓ Consider the following criteria when assessing risk:
  - The vulnerability of the mitigation to and the extent of the effect of different hydrologic conditions than those proposed.
  - The vulnerability of the mitigation to the establishment and long-term viability of plant communities other than that proposed.
  - The vulnerability of the mitigation to colonization by invasive exotic or other invasive species.
  - The vulnerability of the mitigation to degraded water quality.
  - The vulnerability of the mitigation to secondary impacts due to its location, considering potential land use changes in surrounding area, existing protection provided to surrounding areas by easements, restrictive covenants, or federal, state, or local regulations, and the extent to which these factors influence the long-term viability of functions provided by the mitigation site.
  - The vulnerability of the mitigation to direct impacts.

#### **Preservation**

#### Preservation Requirements in Mitigation Rule, 33 CFR § 332.3 (h)(1):

- 1. The resources to be preserved provide important physical, chemical, or biological functions for the watershed;
- 2. The resources to be preserved contribute significantly to the ecological sustainability of the watershed. In determining the contribution of those resources to the ecological sustainability of the watershed, the district engineer must use appropriate quantitative assessment tools, where available;
- 3. Preservation is determined by the district engineer to be appropriate and practicable;
- 4. The resources are under threat of destruction or adverse modifications; and
- 5. The preserved site will be permanently protected through an appropriate real estate or other legal instrument (e.g., easement, title transfer to state resource agency or land trust).

#### **Preservation Adjustment Factor in UMAM**

The Preservation Adjustment Factor (PAF) is used in conjunction with the Qualitative, Part II Assessment and Scoring \when considering "Preservation" Mitigation.

#### PAF score is based on:

- 1. The extent the preserved area will promote natural ecological conditions, i.e., fire patterns, exclusion of invasives, etc.
- 2. The ecological and hydrological relationship between wetlands, other surface waters, and uplands to be preserved.
- 3. The scarcity of the habitat provided by the proposed preservation area and the level of use by listed species.
- 4. The proximity of the preserved area to areas of national, state, or regional ecological significance, and whether the areas to be preserved include corridors between these habitats.
- 5. The extent and likelihood of potential adverse impacts if the assessment area were not preserved.

| ĺ | Enhancement         | 22331 - Bottomland Forest Wetlands  | Palustrine Forested | 8            | 8    | 8       | 8    | 7         | 9    | 0.07  |                            | 1    | 1.017       | 0.00                   | 3.77              | 0.25       |

Enhancement to the community structure (invasive/exotic species removal) of 3.77 acres of palustrine forested wetlands necessary to mitigation for project impacts to WOTUS.

Results in a functional gain of 0.25 palustrine forested wetlands.

### **Jacksonville Mitigation Guidance**

RIBITS: Although catered to mitigation banking, the below guidance and templates are also relevant to PRM.

- Mitigation Banking Instrument Template and Instructions
  - Detailed recommendations
  - Formulas to calculate appropriate long-term financing mechanism funding amount.
  - Performance standard recommendations.
  - Baseline data needs.
  - Items to consider for evaluation
  - Standard adaptive management provisions.
  - Monitoring recommendations.
- Cost estimate spreadsheet for financial assurances.
- Financial assurance templates.
- Cost estimate spreadsheet for long-term management.
- Long-Term Financing Mechanism templates.
- Deed of Conservation Easement for Mitigation Banks with Third Party Beneficiary Rights template.
- Jacksonville District credit classification guidance.
- Supporting technical reference information.

This section is intended to contain templates specific to compensatory mitigation projects proposed within Florida, which is covered by the Jacksonville District Regulatory Division. Any template available in this section is provided by the Jacksonville District Regulatory Division in an effort to assist proponents of third party mitigation projects in the development of technically sound, biologically successful compensatory mitigation projects. The information and guidance provided in any template available in this section should be looked at as a suggestion for format and content. Providing the information in accordance with the template will help to get things to the Corps in a consistent manner which is intended to facilitate a smoother, more fast paced review process. While you are not required to utilize any template or guidance included within this section, we are

#### Jacksonville District Guidance Documents

This section is intended to contain guidance documents specific to compensatory mitigation projects proposed within Florida The guidance and information contained within any document available in this section is provided by the Jacksonville District Regulatory Division in an effort to assist proponents of third party mitigation projects in the development of technically sound, biologically successful compensatory mitigation projects.

- Guidance on the development of a Mitigation Service Area.pdf | Download | Open File
- . Hydric Rating by Map Unit.pdf | Download | Open File
- . Guidance for Multipurpose MBs and ILFs.pdf | Download | Open File
- Jacksonville District Credit Sales Notification and Verification Process Instructions (8/17/2022).pdf | Download | Open File

This section is intended to contain documents intended to assist in the development of different components of compensatory mitigation projects proposed within Florida. The guidance and information contained within any document available in this section is provided by the Jacksonville District Regulatory Division in an effort to assist proponents of third party mitigation projects in the development of technically sound, biologically successful compensatory mitigation projects. Using the information/quidance provided by these documents will assist in facilitating the development the compensatory mitigation project in a consistent manner which is intended to facilitate a smoother, more fast paced review process.

### **Advanced Permittee Responsible Mitigation Sites**

Advanced Permittee Responsible Mitigation Sites (APRMS) projects have historically been identified as Permittee Responsible Off-Site Mitigation Areas (PROMAs), Regional Off-Site Mitigation Areas (ROMAs), or Advance Permittee Responsible Off-Site Mitigation Areas (APROMAs).

Establishing an APRMS project provides no entitlement to, or guarantee of, use of that APRMS as compensation for any particular project causing impacts to WOTUS unless the APRMS project is approved in conjunction with a Department of the Army (DA) impact permit.

If proposing a new APRMS, please ensure to also include the following in addition to the components of a mitigation plan identified at 33 CFR 332.4(c):

- Identify the permittee to use the mitigation site. Considering the permittee must assume the responsibility for the associated compensatory mitigation, generally the APRMS will typically be used by one permittee who will be clearly identified in the permit letter which authorizes the APRMS project and its compensatory mitigation plan.
- All potential impact projects/sites for which the APRMS project may provide compensatory mitigation must be identified in the application that includes the APRMS project to the extent practicable.
- · Ledger for tracking debits.

It is highly recommended to conduct a pre-application meeting with a mitigation SME prior to proposing an APRMS project.

#### **APRMS**

If proposing to use an existing approved APRMS, please provide the following information:

- 1) Written justification demonstrating why the use of the APRMS is environmentally preferable in accordance with 33 CFR § 332.3(b).
- 2) Reference to the approved APRMS project including SAJ project number.
- 3) A summary of compliance with the Corps-approved APRMS compensatory mitigation plan and associated performance standards, including monitoring report results completed at the time of submittal of the DA permit application or the most recent monitoring report if less than one year old.
- 4) Description of how the APRMS adequately compensates for the unavoidable impacts to WOTUS associated with the proposed project.
- 5) Proposed amount and type of credits the applicant believes is necessary to offset unavoidable losses of WOTUS. The Corps retains the final decision on the type and amount of compensatory mitigation required for a specific DA permit.

of Engineers ®

6) An up-to-date ledger displaying the availability of credits at the APRMS project.
