

Focus on Pump Protection

LPD Strainer

Low pressure differential
"Y" strainer

Flow through design — no obstructions and lower pressure loss

Flow capacity often exceeds basket strainers of the same size — no need to upsize

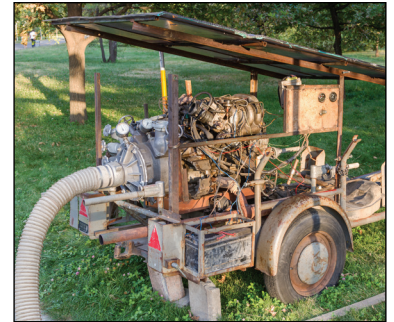

Installation options vertical & horizontal 4 to 8 o'clock allowed — less clearance than most basket strainer sizes

More open area to pipe — less clogging

Significantly larger screen — less clogging & more storage

Manual or automatic flushing port — minimizes service

Reduce energy and maximize performance

Introducing new, uniquely engineered components that lower pressure losses and reduce turbulence to maximize pump life and system performance.

Low Pressure Drop (LPD) Strainer

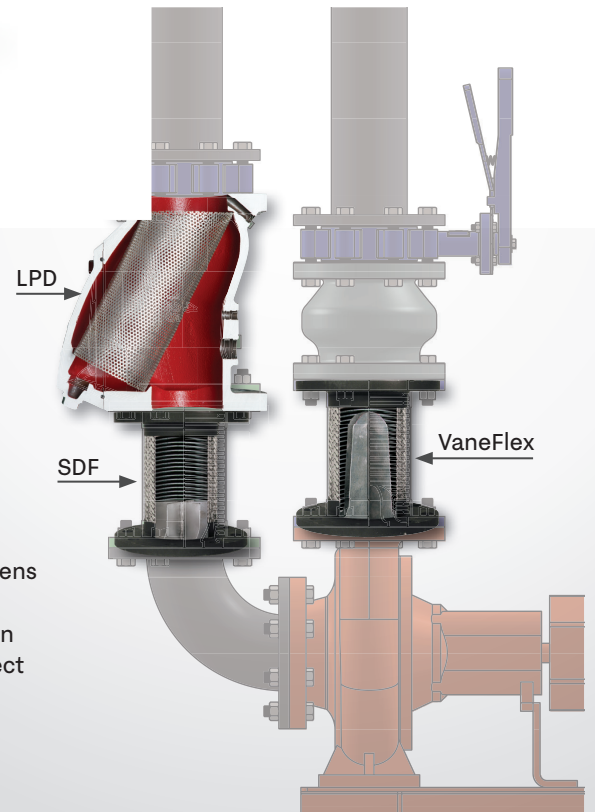

Designed with very low pressure losses. Saves energy, improves pump performance and reduces maintenance.

Suction Diffuser Flex (SDF)

Significantly reduces turbulence to maximize pump performance, reduce wear and increase pump life.

VaneFlex™

Immediately straightens flow before and after the pump, in a fraction of the space, to protect components from fluid turbulence.
