V _{FE} Slats + 20 Flaps	190 KNOTS
V _{FE} Slats + 48 Flaps	175 KNOTS
Maximum for opening Direct Vision Window	180 KNOTS
Maximum Tire Speed (Ground).....	180 KNOTS

Auxiliary Power Unit:

Exhaust Gas Temperature:

Maximum Rated	680° C/1256° F
Maximum Allowable	732° C/1350° F

RPM:

Maximum Rated	100%
Maximum Allowable	110%
Maximum Generator Amperage.....	300 AMPS

NOTE

With Bleed Switch ON, do not perform engine or airframe anti-ice tests.

Engine Operation

GARRETT TFE 731-3-1C

RPM Limits:

	N ₁	N ₂
Takeoff/Maximum Continuous	101.5%	100.0%
One Minute Maximum Allowable	103.0%	103.0%
Transient 5 Seconds Maximum Allowable	105.0%	105.0%

ITT Limits:

		-3	-3D
Starting	Normal	907° C	910° C
Ground	Transient (10 Seconds Max)	927° C	929° C
Air	Transient (5 Seconds Max)	977° C	971° C
Takeoff	Normal (5 Minutes Max)	907° C	910° C
	Transient (10 Seconds Max)	917° C	912° C
Maximum Continuous		885° C	910° C

Starting Time:

Ground Start and Starter Assist Airstart	From 10% N ₂ speed to light-off	10 Seconds Maximum
Windmilling Airstart	From Windmilling N ₂ speed to 60% N ₂	25 Seconds Maximum
Ground Start	From Light-off to idle	50 Seconds Maximum

Oil Pressure:

Thrust Setting	Minimum Pressure	Maximum Pressure
Takeoff or Maximum Continuous	38 psi	46 psi
Idle	25 psi	46 psi
Transient (Less Than 3 Minutes)		55 psi

FALCON 50 PILOT CHECKLIST

Oil Temperature:

Sea Level to 30,000 Feet.....	127° C MAXIMUM
Above 30,000 Feet	140° C MAXIMUM
Transient (Less than 2 Minutes)	149° C MAXIMUM
Minimum for Initiating Take Off, and Continuous Operation.....	30° C

Electrical System:

D.C. Distr. System Maximum Voltage	32 VOLTS
Generator Normal Voltage	28.5 VOLTS
Maximum Amperage:	
Transient (1 Minute Maximum)	350 AMPS
Up to 39,000 Feet	300 AMPS
Above 39,000 Feet.....	250 AMPS

Thrust Reverser:

The thrust reverser is approved for ground use only. It must not be used for taxiing in reverse.

Miscellaneous

Maneuvering Flight Load Factors:

Flaps Up+2.6 G TO -1.0 G

Flaps Down.....+2.0 G TO 0 G

Recommended Turbulent

Air Penetration Speed.....280 KNOTS/0.76 MACH

Maximum Allowable Runway Slope±2.5%

Limiting Tailwind Component10 KNOTS

Demonstrated Crosswind Component23 KNOTS

Maximum Allowable Water Depth for Takeoff3/4 INCH

Ambient Temperature at Sea Level for

Takeoff/Landing-54° C TO + 50° C

Engine computers must be operative for takeoff.

The engine synchronizer system must not be used during takeoff, landing, and missed approach.

Pressure Refueling System Maximum Feed Pressure50 PSI

Cabin Pressurization Max ▲.....9.1 PSI (9.5 PSI W/SB 163)

ADDITIONAL INFORMATION

FLAP OPERATION.....	AI-1
AIRBRAKE OPERATION.....	AI-1
THRUST REVERSER OPERATION.....	AI-1
FUEL MANAGEMENT.....	AI-1
AIRCRAFT OPERATION IN ICING CONDITIONS	A-3

**ADDITIONAL
INFORMATION**

FLAP OPERATION

1. In flight, extend or retract the flaps to the next detent only after cessation of movement to the previous detent position.
2. Do not extend the flaps if the slat green light is not on.

AIRBRAKE OPERATION

1. The pilot should keep his hand on the control handle until proper extension or retraction of the airbrakes is ascertained.
2. If the maximum operating speed limit V_{MO}/M_{MO} is inadvertently exceeded, do not hesitate to use the airbrakes.
3. Extension of the airbrakes within 500 feet from the ground is not recommended.

THRUST REVERSER OPERATION

Full reverse thrust is usable until the airplane comes to a complete stop. However, in cross wind conditions, a 5% reduction of engine N₁ is recommended shortly before the complete stop is reached.

On landing, do not attempt a go-around after reverse thrust has been selected.

FUEL MANAGEMENT

FUELING

1. Pressure fueling

NOTE

Illumination of the **STOP FUELING** light calls for immediate interruption of the fueling operation.

Continued on Next Page

FUEL MANAGEMENT (Cont)

2. Overwing fueling

NOTE

Do not pour non-diluted additives into an empty tank.

LOW TEMPERATURE CRUISE

In case of extended cruise in cold atmosphere, with total air temperature below fuel freezing point, wing-to-feeder tank transfer may be lost.

1. Therefore monitor:

- The total air temperature,
- The fuel temperature indicator (SB F50-136).

2. Carefully monitor the transfer.

3. If necessary, increase mach number or decrease altitude to raise:

- The total air temperature above 13° C (23° F) below the fuel freezing point,
or
- The fuel temperature above fuel freezing point + 3° C (5° F).

TRANSFER

The transfer pumps should be switched off when there is no fuel left in the wing tanks.

XFR INTERCOM and X-FEED Systems

These systems should be deactivated for take-off, approach and landing.

FUEL QUANTITY INDICATORS

The selector switch should be in the normal REAR position.

AIRCRAFT OPERATION IN ICING CONDITIONS

ANTI-ICE

Icing Conditions

Icing conditions exist when the OAT on the ground and for take-off, or TAT in flight is 10° C or below, and visible moisture in any form is present (such as clouds, fog with visibility of one mile or less, rain, snow, sleet and ice crystals).

Icing conditions also exist when the OAT on the ground and for take-off is 10° C or below when operating on ramps, taxiways or runways where surface snow, ice, standing water, or slush may be ingested by the engines or freeze on engines, nacelles or engine sensor probes.

Engine Anti-Ice

The engine anti-ice system must not be used with total air temperature in excess of + 10° C.

Wing Anti-Ice

The wing anti-ice system must not be used with total air temperature in excess of + 10° C.

The wing anti-ice system must not be used on ground except for limited checks conducted in accordance with *Airplane Flight Manual* or *Maintenance Manual* instructions.

CAUTION

Extended flight in icing conditions with airplane in S+FLAPS 20 or S+FLAPS 48 configuration must be avoided.

Continued on Next Page

AIRCRAFT OPERATION IN ICING CONDITIONS (Cont)

TAT	-30 TO -20° C	-20 TO -10° C	-10 TO 0° C	0 TO +10° C
Minimum N ₁ speed in cruise condition	84%	81%	78%	73%
Minimum N ₁ speed in approach condition	78%	78%	78%	73%
One engine inoperative condition	91%	88%	84%	80%

If necessary during approach, extend airbrakes to help keep N₁ speed to no less than specified value, and increase approach speeds.

POS 1 – V_{REF} + 10 KTS

POS 2 – V_{REF} + 15 KTS

Extension of the airbrakes within 500 feet from the ground is not recommended.

SLAT SYSTEM OPERATION

Should the slats fail to fully retract when retraction is initiated in icing conditions (red transit light on):

1. Maintain airspeed to V_{FE} (200 KIAS) or below.
2. Leave wing anti-ice system on and maintain engine speed to no less than specified minimum.

WINDSHIELD ANTI-ICING**CAUTION**

Selection of the WINDSHIELD PILOT and COPILOT switches to the MAX position should be limited to those icing conditions encountered in flight such that the ice protection afforded in the NORM position is inadequate.

- N.L. (Not limitative) allows A/C weight up to Maximum Design Weight.
- Corresponding T.O.W. assumes take-off and direct climb 260 KIAS/.72MI up to given altitude. (No credit for taxi, nor acceleration up to a given Mach number).

CORRECTION FOR WIND

Wind Gust + 1/2 Steady State (Maximum 20 Knots)

TAT	-30 to -20° C	-20 to -10° C	-10 to 0° C	0 to +10° C
Minimum N ₁ speed in cruise condition	84	81	78	73
Minimum N ₁ speed in approach condition	78	78	78	73
One engine inoperative condition	91	88	84	80

If necessary during approach, extend airbrakes to help keep N₁ speed to no less than specified value, and increase approach speeds (+10 knots if position 1, +15 knots if position 2).
