

Stake ID	Sex	Completed	Note
CZEX-2	Male*	December 19, 2019	This sample had a result pattern that is not typical of normal males or normal females. It displayed excess male target which placed it outside of the normal female range but not within the range of a normal male. We see them at a consistent, but low rate across many different strains. We recommend they be treated as males and removed to be safe. We also have empirically seen that they are commonly seen with incorrect collection and subsequent contamination.
