Feedback Calibration System

KFC-21

Robust design

- Aluminum case with Die cast front and rear bezels for extra strength & durability
- Large LCD display
- Auto switching power supplies for either 120/240V input power
- Custom high accuracy digital micrometer

Exclusive features:

- KMN-SENSE:
Automatically detects and alerts user when a bad feedback sensor is connected
- Plug & Play feedback interface allows KFC-21 to be used virtually anywhere-no engraver required

Backed by our 2 year warranty

Vision Engraving heads with feedback control systems are renowned for excellent engraving quality, consistency, and flexibility to cover a wide range of screen/angle/diamond combinations. But problems caused by dirty or damaged Kaman feedback sensor can be disastrous and very expensive. Common Kaman sensor failure symptoms include, extremely poor cell shape, cell instability (ringing or drift) and even cause catastrophic damage to the engraving head, amplifier, or power supply.

KFC-21 is a powerful tool designed with ease of use and value in mind. Simple to use instructions with Plug & Play interface enables users to easily clean, test, calibrate or even replace Kaman feedback sensors. Perfect for routine maintenance or diagnosing common engraving head problems. OES exclusive KMN-SENSE automatically detects a bad sensor when connected. Users will now be able to have spare feedback sensors (OES# KFS-001) in their stock for rapid replacement minimizing engraver downtime.
