ST. FRANCIS MEDICAL CENTER

DATE: 01/02/2015

SURGEON: Brad D Dresher, MD

PREOPERATIVE DIAGNOSIS: Status post open reduction, internal fixation with bone grafting, navicular and XFix placement on medial column.

POSTOPERATIVE DIAGNOSIS: Status post open reduction, internal fixation with bone grafting, navicular and XFix placement on medial column.

PROCEDURE: XFix removal, left foot.

ASSISTANT: Robert S Valdez, PA-C. Assistant was used during this case to help protect the left lower extremity, help position the left lower extremity, and use of the assistant during this case increased overall efficiency.

COMPLICATIONS: None.

CONDITION: Stable to recovery.

ANTIBIOTICS: No antibiotics given.

COUNTS: Correct.

TIME-OUT: Documented on form.

INDICATIONS: This patient is a 30-year-old female who is 31 weeks pregnant. She suffered a left navicular fracture, underwent open reduction, internal fixation and XFix placement over 6 weeks ago. This is her scheduled day for XFix removal. The risks were given to her including blood loss, nerve damage, infection, complications to anesthesia up to including death, need for further surgery, DVT and PE. We also discussed risks of her unborn baby, and she wished to proceed with the procedure. On the day of the surgery, she was met in the preoperative area. The primary surgeon's initials placed on the left lower extremity. She was then taken to the operative suite, gently transferred to the operating room table. General LMA anesthesia was performed. A well-padded, snug fitting tourniquet was not placed. The left lower extremity from the knee down was cleaned and draped in sterile fashion. The XFix was removed without complication. Using sterile curettes, the bone tunnels were curetted. This skin was cleaned of any thrombus or accumulated skin. Both pin sites were free from
