Liquid Flattening Agent

Product Number:

950-4 Quart

SPI Liquid Flattening Agent Qualities:

SPI Flattening Agent is a high strength semi-gel type product that utilizes the finest raw flattening agent available. This product is very high strength and stays in suspension well, though always pre-mix or pre-shake before adding to a coating

Reducer Selection:

If you are using this Liquid Flattening Agent in a coating that requires reduction, always use the proper speed activator and/or urethane reducer in that coating.

Mixing:

Mix or shake this product thoroughly before each use! Then gradually add 950 Liquid Flattening Agent until the desired flatness is achieved and verified on a test spray-out panel.

Normally 20-40% of activated material is what is commonly used and for a low sheen, 20-30% will be a very good starting point.

Spray a Test Panel First:

As with any flattener, always spray a test panel first and allow it to totally dry for full flattening effect as no two products are alike and everyone's idea of semi-gloss or flat is different! Different coatings will require different amounts of flattener. True flattening will always take about 24 hours after spraying which is why you always do a test panel first.

Common Mistakes:

- 1. Not allowing the first coat to properly flash (30 min) before applying the second coat
- 2. Spraying back-to-back wet coats
- 3. Using wrong speed reducers and activators will also counteract effect
- 4. Not allowing enough dry time to check for proper flatness before adjusting
- 5. Seeing 'snowflakes' means too much air pressure

All these common mistakes will override the properties of the flattening agent!

General guidelines:

Customer feedback on Universal Clear for a totally flat application:

Mix one quart of clear with one quart of activator and one quart of flattening agent. Lower your normal clear spraying air pressure by 5-10 lbs or just high enough to spray clear the way you want.
