

Cockroach Treatment Prep Sheet

For best results follow the preparation instructions below. Skipping steps may prevent proper control of pest activity.

Cockroach activity is one of the most difficult pests to control, given their elusive nature and quick reproduction cycle. A proper control plan and preparation can help aid in the effectiveness of each treatment.

Step #1: Roaches often harbour in the small gaps behind and underneath cupboards and counters. Please ensure all kitchen and bathroom cupboards are either accessible for baiting or emptied for spraying.

Step #2: Pull all furniture away from the walls to make baseboard perimeters accessible.

Step #3: Remove all items from top of appliances and all shelving.

Step #4: Remove all clutter, food debris, grease, and standing water from all areas and surfaces prior to service, and on a regular basis.

Please note: *If a spray treatment is being done, all pets and people must vacate for 4-6 hours.*
