

## **OPTOMAP RETINAL EXAM:**

A thorough retinal exam is a crucial part of your comprehensive eye exam. This advanced technology is used by the doctors to detect early signs of retinal disorders, including but not limited to: **glaucoma, cancer, diabetic retinopathy, high blood pressure, macular degeneration, and retinal detachment.**

By performing the OPTOMAP retinal exam, the doctors will likely not dilate your eyes unless the test reveals undetected eye disease. It is particularly helpful when you return for your annual exam as it provides a permanent record of your retinal condition, and each subsequent year the OPTOMAP images can be viewed side by side to discover subtle changes and monitor your continuing eye health.

There is a \$30 co-pay associated with this procedure that insurance companies do not cover.

Please choose one of the following options:

- Yes, I would like the OPTOS retinal exam instead of dilation. I understand there may be a \$30 charge if my insurance does not cover the procedure or if I am a private pay patient.**
  
- No, I do not want the OPTOS retinal exam and choose to be dilated instead, which is included in the cost of a comprehensive eye exam.**
