

## ***Xpel Nano Ceramic Window Film Aftercare***

### ***Initial Curing Period (3-7 Days):***

**Avoid rolling down windows:** This allows the adhesive to fully bond to the glass.

**Moisture and haziness:** It's normal to see moisture or haziness between the film and glass during this period. This is part of the curing process and will dissipate as the adhesive dries.

**Don't touch or poke:** Avoid touching or attempting to push around any moisture or bubbles.

### ***Cleaning and Maintenance:***

**Wait before washing:** Avoid washing the car for at least 3 days, or longer in colder weather.

**Hand wash only:** Use a soft microfiber cloth and a non-ammonia based cleaner like Spray Away or a 50-50 mix of alcohol and water.

**Avoid harsh chemicals:** Do not use harsh chemicals or abrasive cleaners as they can damage the film.

**Be mindful of sharp objects:** Be careful with sharp or hard objects (especially seatbelts) near the tint, as the scratch-resistant coating is still susceptible to damage.
