## Lake Maintenance Service Report

**ACCOUNT:** Viewpoint Lake, Sun City Recreation  
10626 West Thunderbird Blvd, Sun City, AZ 85351

**TO:** Eddy Renio / Terry Klatt

**FROM:** Janet Scheffman / 950158

**DATE:** Week of 04 May 2026

**FAX #:** (623) 876-8341

The water levels remain at normal full levels after the lake was refilled in November (2023). There has been no recent rainfall and the water levels up slightly from last week.

All four of the fountains are operational; 103<sup>rd</sup> Av, Bayside, Cameo and the Rec Center and all fountains running this week.

Waterfall pump was operational and there is water movement in the lagoon and down the streams into the main lake.

There was only a very small amount of floating bottom algae seen and all the growth was located in the Cameo cove.

The spring lake turnover is over and water chemistry and conditions are normal for late spring.

The 4 street grates adjacent to the lake are treated with dry larvicide dunks once a month year-round (the first week of the month).

The lake is well stocked with goldfish to consume larvae in the main lake and there was an addition of more goldfish and blue gill in the lake and lagoon in February and in April.

There are complaints of midge flies from homes adjacent to the lake. I completed the third of three weekly vectobac larvicide (10 gallons) applications to combat the larval stages of the midge flies last week.

The grates and lagoon are treated and the lagoon is the most likely point for the midges to hatch from. The lagoon is shallow with dozens of small areas around the rocks that are stagnant and ideal for midges.

The lagoon will be continue to be treated with larvicide 3 times a month until late in the fall. In the 4<sup>th</sup> week of the month, I will treat algae growth in the lagoon as needed.

## Viewpoint Lake service report

### Page 2/2

This year was ideal for midge flies to hatch in large numbers; it was short winter but no days below freezing, an early spring warm up with triple digits in March and several days of rainfall in the winter months.

Average surface temp: 78.4 F

Average bottom temp: 77.9 F

Salinity: 0.2 ppt

Dissolved oxygen: 5.48 mg/L (surface) / 5.19 (bottom)

Secchi: 5 feet 01 inches

pH: 8.2

Current water levels: +3.0

There has been a slight cool down in temperatures so very little change in the water chemistry again this week. The summer triple digits will be back in the next few days and the temperatures will increase more rapidly.

Slight decrease in clarity with some increased planktonic algae growth the past couple weeks but no treatments needed and the color and clarity are still great.

No waterfowl mortality seen but only one coot seen but still some Canadian geese.

Two dead trout and one dead bass removed.

The water levels are back to the normal levels so the boat ramp is treated with algaecide every other week as a safety precaution to reduce risk of slippery algae growth.

Warning:   X  

Pesticides can be hazardous. Please keep children and pets away until applications are dry, dissipated, or aerated. For additional information contact Hurricane Aquatics (license # 5746) at (602) 619-8492.
