Lake Maintenance Service Report

ACCOUNT: Viewpoint Lake, Sun City Recreation
10626 West Thunderbird Blvd, Sun City, AZ 85351
TO: Eddy Renio / Terry Klatt
FROM: Janet Scheffman / 950158
DATE: Week of 08 June 2026
FAX #: (623) 876-8341

The water levels remain at normal full levels after the lake was refilled in November (2023). No recent rainfall and the air temperatures are back in the triple digits.

All four of the fountains are operational; 103rd Av, Bayside, Cameo and the Rec Center and all fountains running this week. Waterfall pump was operational and there is water movement in the lagoon and down the streams into the main lake.

The filamentous algae growth in the lagoon is treated in the last week of the month and the vectobac larvicide is done the first three weeks of the month. There was less filamentous growth in the lagoon again this week.

The addition of more goldfish and the full vectobac larvicide treatments (in the lake and lagoon) this spring have reduced the midge fly populations.

The 4 street grates adjacent to the lake are treated with dry larvicide dunks once a month year-round (the first week of the month).

The lake is well stocked with goldfish to consume larvae in the main lake and there was an addition of more goldfish and blue gill in the lake and lagoon in February and in April.

The grates and lagoon are treated and the lagoon remain the most likely point for the midges to hatch out from. The lagoon is shallow with dozens of small areas around the rocks that are stagnant and ideal for midges.

The only few midges that were seen in the past weeks were near the lagoon, there were no midges around the boat ramp or in the main body of the lake.

Viewpoint Lake service report

Page 2/2

There was some bottom algae seen in the more shallow perimeter areas but no floating bottom algae so the fish are keeping the bottom algae growth in check.

Average surface temp: 83.7 F

Average bottom temp: 83.2 F

Salinity: 0.2 ppt

Dissolved oxygen: 5.14 mg/L (surface) / 4.80 (bottom)

Secchi: 5 feet 04 inches

pH: 8.2

Current water levels: +2.5

The water temperatures have reached the 80s this month and usually reach the maximum temperatures in later summer.

Slight decrease in clarity with some increased planktonic algae growth in April and May but the clarity remains very good for the summer months. No surface planktonic algae blooms seen and no filamentous growth.

No waterfowl mortality seen.

No fish losses; safe assumption all the remaining trout have died back.

The majority of the trash and debris had accumulated in the Cameo cove again but all debris was removed.

The water levels are back to the normal levels so the boat ramp is treated with algaecide every other week as a safety precaution to reduce risk of slippery algae growth.

Warning: X

Pesticides can be hazardous. Please keep children and pets away until applications are dry, dissipated, or aerated. For additional information contact Hurricane Aquatics (license # 5746) at (602) 619-8492.
