## Lake Maintenance Service Report

**ACCOUNT:** Viewpoint Lake, Sun City Recreation  
10626 West Thunderbird Blvd, Sun City, AZ 85351

**TO:** Eddy Renio / Terry Klatt

**FROM:** Janet Scheffman / 950158

**DATE:** Week of 02 March 2026

**FAX #:** (623) 876-8341

The water levels remain at normal full levels after the lake was refilled in November (2023) no recent rainfall.

All four of the fountains are operational; 103<sup>rd</sup> Av, Bayside, Cameo and the Rec Center and all fountains running this week.

Waterfall pump was operational and there is water movement in the lagoon and down the streams into the main lake.

No bottom algae seen and still only limited planktonic algae growth in the water column but a slight increase in algae growth in the water column.

The first weeks in February and into March are unseasonably warm in the afternoon and only cool evening temperatures and the water temperatures starting trending up earlier than normal.

The 4 street grates adjacent to the lake are treated with dry larvicide dunks once a month year-round.

I started the treatment for midges in the lagoon area on a regular basis starting this week. The population of midges remain low and have only been seen in the area of the lagoon and not in the main body of the lake.

The lake itself is already well stocked with goldfish to consume larvae in the main lake and the addition of more goldfish and blue gill last month in the lake and lagoon will also increase the control of midge flies.

There was some filamentous algae growth in the lagoon area but since I treated with larvicide I did not treat with algaecide because algaecide decreases the efficacy of the larvicide applications

## **Viewpoint Lake service report**

### **Page 2/2**

Average surface temp: 64.8 F

Average bottom temp: 64.6 F

Salinity: 0.2 ppt

Dissolved oxygen: 6.16 mg/L (surface) / 6.12 (bottom)

Secchi: 5 feet 03 inches

pH: 8.2

Current water levels: +0.0

No waterfowl mortality seen and some of the migratory seasonal birds will start to fly out over the next few weeks.

7 dead fish total this week: 3 grass carp, 2 bass, and 2 catfish. It is common to lose a handful of fish for several weeks in the spring as the lake heats up and the top and bottom waters mix.

The trout acclimated well and no mortality seen again this week but soon the temperatures will be stressful for the remaining trout.

Periodic treatments are done twice a month with algacide on the boat ramp and I will start those treatments next week.

Warning: None

Pesticides can be hazardous. Please keep children and pets away until applications are dry, dissipated, or aerated. For additional information contact Hurricane Aquatics (license # 5746) at (602) 619-8492.
