

Clownfish are the best. Very pretty, and they come in a variety of patterns. I am told that some aren't actually clownfish, but they are all "anemone fish" and I am not sure which are which. Apparently, Nemo, himself, was an anemone fish, and not a true clownfish. Who would have thought?

I was actually trying to take a picture of clownfish, with a little blue water in the shot for color (see the next page) when I noticed these two angel fish kissing at the top of the frame. There is no way I could have gotten this shot if I was trying!

I believe this fish is also an angel fish, but I have no idea which of many, many types of angel fish it is. If there are any fish experts out there who want to tell me the more complete names of any of these fish, please do: [roger@sipmac.com](mailto:roger@sipmac.com)

The giant clams in both Fiji and on the Great Barrier Reef in Australia have spectacular colors.

I am not sure if this is a nudibranch or a flatworm.

This is a “ribbon eel” I am told. He was not very big, maybe sticking out of the rocks by six inches.

This was a small fish. I don't know what it is, but I loved its purple color and the dorsal fin sweeping back.

That's it for this trip! Now that I know how to work the camera, I hope I can provide more shots when I get to the location of my next adventure.
