

ANYCALLS:

Make communication easier and more convenient

Product Overview

AnyCalls

AnyCalls is a groundbreaking technology that enables users to communicate across multiple call platforms via a single gateway by combining previously incompatible calls from GSM, landline, and VoIP platforms.

Problems

Fragmented communication:

With the rise of messaging apps, people are increasingly using multiple platforms to stay in touch with their friends, family, and colleagues. However, switching between apps can be frustrating and time-consuming.

Difficulty making conference calls across different messaging apps and GSM providers:

When trying to make conference calls across different messaging apps and GSM providers, users often encounter technical challenges that prevent them from connecting all the participants. For instance, if one participant is using WhatsApp and another is using Telegram, it can be difficult to establish a conference call between them. Additionally, different GSM providers may have varying capabilities and limitations when it comes to conference calling. This can result in dropped calls, poor call quality, or an inability to connect all parties to the same call.

Expensive roaming fees:

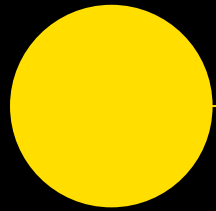

When traveling internationally, making phone calls can be prohibitively expensive due to high roaming fees.

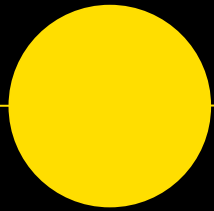

AnyCalls

Solutions

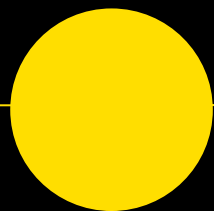

AnyCalls provides a comprehensive solution to:

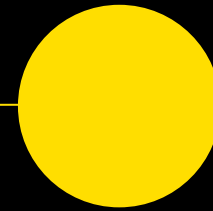

**Fragmented
communication across
multiple messaging apps**

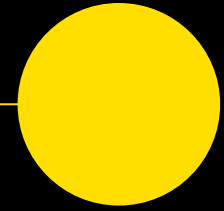

**Expensive
roaming fees**

**Unlimited control
over calls**

**Full call status
notifications**

Conference calls

AnyCalls

Receive incoming calls from any VOIP messenger

To the account linked with a virtual number without a physical installation on the user phone

AnyCalls

Outgoing calls to different VOIP messaging

A revolutionary solution that merges previously unmerged calls from GSM and VOIP platforms, allowing users to call from WhatsApp or any other messenger to a regular landline or mobile phone (even if the business or person does not use WhatsApp or any other messenger).

Each messenger is like a package of services for outgoing calls

AnyCalls

From the virtual number to the destination
in the PSTN

Make a PSTN call

When traveling internationally, making phone calls can become prohibitively expensive due to high roaming fees.

AnyCalls addresses this issue by providing users with local phone numbers, allowing them to make local calls and significantly reduce roaming costs worldwide.

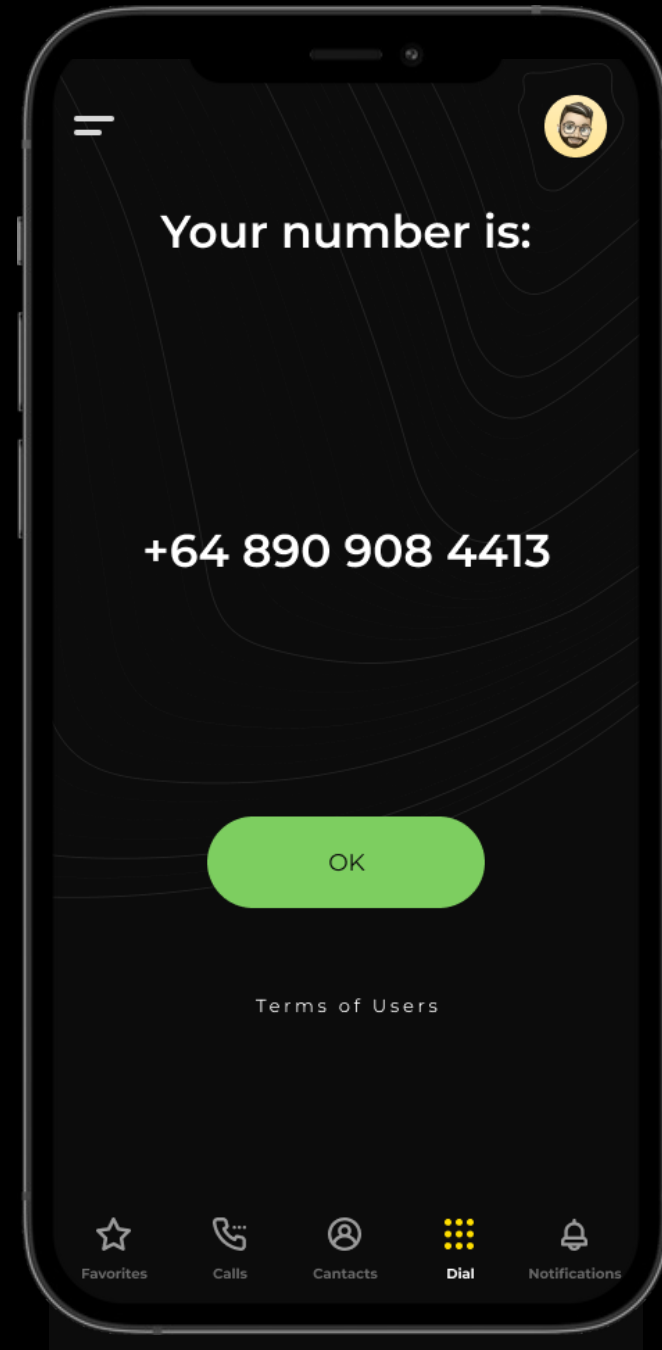

AnyCalls

Unlimited control over calls

By tracking statuses of the calls, the app gives you full control for all your calls from any network and allows you to put calls: on hold, record, decline with specific voice message, create conferences from different networks, AI answering machine etc.

AnyCalls

Full call status notification

That the user is on the call by text or audio notification

The app notifies you of incoming calls from each source, you can answer or auto-answer with a recognized call waiting for tones or individualized messages to individual contacts or collectively.

AnyCalls

AnyCalls makes it easier for users to conduct conference calls across Voip and GSM providers. With AnyCalls, users can bring together participants from various platforms and providers, reducing the complexity and hassle of coordinating a group call.

**Conference Call Across
Messengers and GSM Providers**

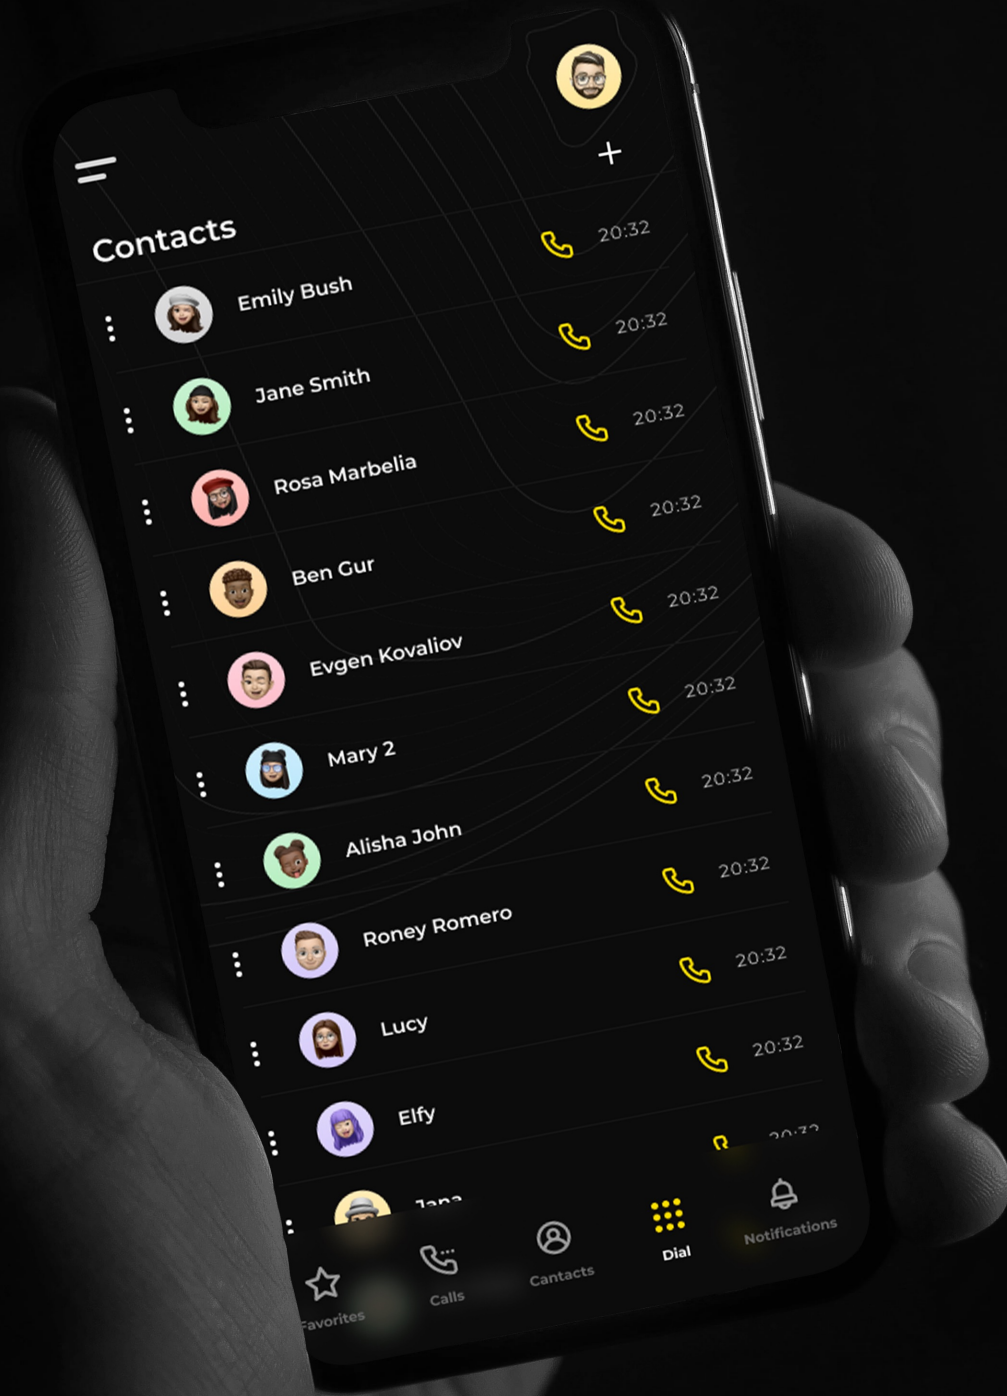

AnyCalls

Real time synchronic voice translation:

AnyCalls offers real-time voice translation during phone calls, making it easy to communicate with people who speak different languages.

Have a real-time conversation without any language barrier.
