

WEEPHOLES ARE A CRITICAL COMPONENT OF PRECAST HOLLOWCORE PLANK

- **Hollowcore Planks are not a waterproof system by themselves. Planks must be protected from water exposure during your project. Water infiltration into the hollowcore planks is a common problem. Water intrusion comes from many sources, not just rain, or jobsite conditions such as wet coring and cutting, cleaning to name a few. This water will become entrapped in the plank.**
- **Drill weepholes as soon as possible after Hollowcore Planks are erected.**
- **Provide your structure with immediate continuous drainage throughout your project.**
- **Drilling into Planks that are cured gives a clear drainage hole for water to flow from, draining your planks quickly. Factory Installed Weepholes, typically get clogged while plank is curing, need redrilling or weepholes to be entirely redrilled onsite.**
