Geotechnical Investigation

A successful project begins with a strong foundation, essentially the ground it's built on.

As a trusted provider of geotechnical consultancy services, we bring the expertise required to investigate the subsurface conditions, reducing ground-related risk to your investment.

Our geotechnical engineers and geologists have extensive experience in scoping, planning, and management of site investigations in various ground conditions and market sectors including residential, commercial, transportation, water and renewable energy projects.

Whether your project is in a remote area or involves multiple locations, we're ready to meet the challenge. Clients rely on our ability to efficiently gather and analyze critical data. Our techniques for collecting this information include a suit of soil and rock drilling methods, disturbed and undisturbed sampling, laboratory testing, test pitting, trenching, boring, in-situ testing, and seismic investigations.

Our clients can expect our site investigations to be accompanied by high quality factual and interpretive reports, which are obsessively reviewed to comply with relevant Australian standards and our quality assurance processes.

With extensive experience of geotechnical site investigations across diverse geological horizons of Victoria, we know the challenges associated with various geological units and their unique geohazard, risks, and opportunities.

At Yarra Geotechnics, we engage the most trusted drilling subcontractors, which are shortlisted with scrutiny, based on years of experience working with different suppliers in challenging ground conditions across Victoria and beyond.

This is to ensure sufficient resources, and the required technology are always available to meet the challenge, while high standards of health, safety, and environment are adhered.

Our team has the experience of serving major road, rail, water, municipal, resources, energy and renewable energy clients across Victoria, aware of their unique health and safety regulations and inductions.

We have also worked in numerous land development, subdivisions and residential projects, serving property developers, builders, in the private sector.
