

## SECURE, CONTINUOUS, REMOTE, ALCOHOL MONITORING

### HANDHELD, PORTABLE BREATH ALCOHOL MONITORING... PLUS MORE

- Options for scheduled, random, or on-demand testing.
- Immediate notification of the client ID and their test results.
- Ethernet capability enables enrollment anywhere with Internet access.
- GPS location with taken and missed tests.
- The handheld remote breath alcohol tester automatically turns on and prompts client to test.
- Store and Forward technologies ensure all test results (and data) are captured and reported.
- Optional client test reminders via text, or the SCRAM TouchPoint mobile app.
- Rugged and dependable, built for law enforcement and corrections.
- Proven fuel cell technology with ability to test down to 0.00 BrAC.
- Easy to carry, easy to use.

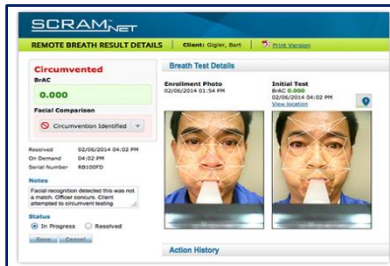

### WORKLOAD REDUCTION WITH AUTOMATIC FACIAL RECOGNITION

- Government security-grade facial recognition—not just photos.
- Real-time client verification.
- Significantly reduces the staff time required to review and confirm client identity.
- High resolution camera ensures clear photos for the 5–10% you do need to review.
- Smart technology improves matches by automatically prompting clients to retake poor test photos.

## AFI CAUGHT MISMATCHED PHOTOS

Client admitted to having his cousin take his scheduled test.

## SCRAM STORES TEST SCHEDULES IN THE UNIT

- Prompts clients when it's time to test, whether or not they're in cell range—making it the only true one-piece unit on the market.

## STORES & FORWARDS TEST RESULTS

- Most portable alcohol breath devices don't record test results without cell coverage. But SCRAM's Remote Breath is mobile, and should be just that: mobile.
- As the only device with STORE & FORWARD, SCRAM Remote Breath can store up to 48,000 test results when out of cell range and forward them automatically when service is reacquired. No matter where clients are, Remote Breath ensures you receive ALL test data.

## GPS LOCATION WITH EVERY TEST

- SCRAM Remote Breath stores test results plus a GPS location with both taken and missed tests—a feature that's proving valuable for the most frequent alert type in remote breath testing: the missed test.
