Our Data Loss Prevention Service is an innovative data protection solution currently in the research and development phase. Designed to offer robust security for your personal and professional data, this project aims to safeguard your digital assets through a multifaceted approach.

Key Overview

Personal Storage Protection:
Data-Ject DLP allows you to select specific folders on your device to protect. This ensures that your personal files are encrypted and monitored for unauthorized access.

Endpoint Security with AI Detection:
The software uses advanced artificial intelligence to detect and prevent security breaches on your chosen devices or endpoints. By identifying anomalies and potential threats, it helps keep your systems secure.

Data Tracking and Deletion:
In the event of data theft, Data-Ject DLP tracks the stolen data and ensures it is deleted, preventing misuse. Additionally, it provides comprehensive reports on such incidents, which are accessible via your user dashboard.

Pricing Model: The planned pricing for the service is $5 USD per 100GB of protected data per month.

This proposes a full device or chosen endpoint protection from breaches, powered by Deep-Learning Intelligence technology.

Current Status:
Our DLP is in the research phase

We are focusing hard on developing and refining the core technologies and features before its official release.
