Patients with cancer have a unique risk profile in the SARS-CoV-2 pandemic. Many patients, especially those actively on treatment, have high levels of contact with the health care system, putting them at an increased risk for SARS-CoV-2 infection and development of COVID-19. Additionally, many if not all patients with cancer are immunocompromised, through the immunosuppressive effects of anti-cancer drugs, supportive medications such as steroids, and cancer itself. Many patients with cancer are over 60 years old, putting them in the highest-risk category for COVID-19-related morbidity and mortality.

Early reports on the prognosis for patients with cancer were conflicting and limited in the number of cases or in the geographic region of data collection.

Given this acute lack of knowledge and concern for extreme vulnerability, the COVID-19 and Cancer Consortium (CCC19) was formed on March 15th, 2020. There are now more than 100 participating sites from the United States, Canada, and Mexico. Many institutional members are large NCI-designated Comprehensive Cancer Centers; large networks of community practices including several NCORP sites are also represented. The driving goal of the CCC19 consortium is to collect and disseminate prospective, granular, uniformly organized information on people with cancer who are diagnosed with COVID-19 – at scale and as rapidly as possible. Through this effort, we will generate hypotheses of factors driving poor outcomes and mortality in this vulnerable population and disseminate findings via informatics platforms and data harmonization efforts with other groups building complementary registries.
