

Why Plant Trees?

Trees are a critical part of the ecological balance on Earth. In addition to providing shade, natural beauty, forests for recreation, homes for hundreds of different wildlife, and job opportunities for industries that use lumber, trees are capable of absorbing carbon dioxide (CO₂) from the atmosphere, reducing the amount of greenhouse gases that are destroying Earth's ozone layer. Trees then, through the process of photosynthesis, return life-giving oxygen to the atmosphere.

CO₂ is the greenhouse gas that is destroying the Earth's ozone layer, resulting in global warming.
