

AJP special mix Banana Feed 250 g

This is a mix of organic fertilizer that is high in nitrogen and potassium which are essential for the production of lush, green growth in leafy plants such as bananas, gingers, cannas, and aroids. The fertilizer has an odour which should dissipate after watering in.

Directions for use

1. Ensure content of bag is well mixed. Unfortunately, there are large pellets and a finer powder which need to be evenly distributed if possible.
2. Use roughly 1-2 tablespoon of the mix added to the top of the compost in large containers (min 12'/30cm) or around the plants in the ground, once a month when plants are in growth (usually March to October). Do not exceed this quantity or the plants may suffer. For smaller pots, use at most 1 teaspoonful.
3. Water the plants immediately after application to soften the pellets and integrate them with the compost.
4. Wash your hands thoroughly after use.
