## How Clarion Junior Works ?

Defocus lenses:

Clarion Junior eyeglasses incorporate defocus lenses, which are lenses with specific optical properties.

These lenses have different focal points for central and peripheral vision, creating a blurred image in the periphery. By stimulating the peripheral retina, these lenses can help slow down the elongation of the eyeball, which is the primary cause of myopia progression.

 **Better academic performance**

 **Enhanced visual experience**

 **Customized prescription**

### Most recommended lens

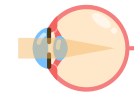

It's important to consult with an eye care professional who can assess your child specific needs and determine the most suitable myopia control options for you, whether it's myopic control eyeglasses, contact lenses, or other methods.

## Main Benefits

### Slowing down myopia

Slowing down the progression of myopia in children & young adult.

### Reducing the risk

Reducing the risk of associated eye conditions.

### Greater convenience

Myopia control lenses can be worn daily or overnight.

### Improved self-esteem

Improved vision with myopia control lenses can help children and young adults feel more confident and comfortable in social situations.
