

Improve escalator and moving walk safety
with AES Safety Brushes

SAFETY BRUSHES

Both black-bristled and yellow-bristled AES Safety Brushes are proven to heighten passenger awareness while significantly reducing the risk of step and skirt entrapments. By forming a physical barrier between passengers and moving escalator parts, they help prevent serious injuries. However, our yellow safety brushes offer an added layer of safety by providing a clear visual contrast between the skirt and steps, encouraging passengers to maintain a safer distance from the edge.

REDUCE ENTRAPMENT RISKS An entrapment risk exists between the stationary skirt panel and the moving step or pallet. Safety brushes, also known as skirt defectors, discourage passengers from standing too close to the edge, reducing the risk of injury and damage to personal property or equipment.
