

Construction Pitch - Skanska

*Subject Line: The Built Environment Accounts for 37% of Emissions Globally*

Did you know buildings account for 37% of greenhouse gas emissions globally? That's why the use of newer materials such as *mass timber, low carbon concrete, and sustainable steel* are such game changers in the construction industry. In fact, California recently enacted several significant pieces of legislation aimed at reducing carbon emissions in new construction projects to drive sustainability within the construction industry.

Skanska, a leading international construction management firm with an ambitious plan to go net-zero with carbon emissions by 2045, is already incorporating sustainable materials and practices into their projects, making them the perfect firm to discuss this new legislation and what it means for local construction projects through the end of this year and beyond. In fact, Skanska recently produced a detailed report on recent Construction Market Trends.

I would love to introduce you to Gordon Childress, Executive Vice President at Skanska to discuss these ongoing issues affecting California.

Thanks,
