

Enriching Macular Pigment helps protect the macula (central retina) from disease and harmful light rays, as well as optimizes visual performance.

The Macula is found at the back of the eye, close to your optic nerve, and is where light entering the eye should focus. In front of the macula is the macular pigment layer, which protects the macula from blue light rays.

UV and non-visible high energy light are filtered out by the front of your eye. Blue light is also very high energy and can cause things like macular degeneration and other macular diseases. The blue light passes through the front of the eye and focuses on the macula and macular pigment layer. This light is found in natural lighting, but also from things like phone and computer screens. The pigment layer is effective in keeping blue light from hitting the macula directly, but this causes the layer to deteriorate over time and, with enough time and exposure, will begin to harm the macula as well.

*A single bottle of MacuHealth is a 3-month supply.*

**At Nova Eye Care we offer MacuHealth for \$80.**

*We also offer multi-bottle discounts!*

For a 6-month supply, we give a 10% discount.

That brings the cost per bottle down to \$72.

For a year supply, we offer a 15% discount, making the bottles \$68 each!

## Patient Information

With over **30 peer-reviewed** publications that demonstrate the formula's efficacy, bioavailability and safety, MacuHealth is at the forefront of preventative treatments for macular disease. The company holds both worldwide exclusivity and a patent on the science-based 10-10-2 formulation. With help from its distribution groups, MacuHealth is now the supplement of choice in the fight against macular degeneration and enhancement of visual function **worldwide**.

The macular pigment layer is made up of three dietary nutrients called carotenoids: **Lutein, Zeaxanthin, and Meso-zeaxanthin**. A healthy diet is essential to maintain this layer; however, today's processed foods are lacking in these vital nutrients, and it is believed that supplementation is the best way to protect your macula.

### Active Ingredients

<b>Meso-Zeaxanthin</b>	10mg
<b>Lutein</b>	10mg
<b>Zeaxanthin</b>	2mg

### Inactive Ingredients

<b>Sunflower Seed Oil</b>	506mg
<b>Vitamin E</b>	3.75 IU
<b>Beeswax &amp; Fatty Acid</b>	39mg
<b>Beef Gelatin</b>	37.5mg

**MacuHealth** with LMZ3 is a patented formulation that contains all three of the macular pigment's nutrients in a formulation which has been shown to outperform alternative formulations. In a randomized controlled trial, only a formulation that contains all three macular nutrients in 10:10:2mg has been shown to appreciably improve visual performance, and has also been shown to outperform alternative formulations. This 10:10:2 ratio found in MacuHealth is the same ratio of the nutrients in the macular pigment layer in your eye.

Studies have shown that visual performance can be improved at any age following supplementation with a formulation that contains all three of macular pigment's constituent nutrients. If you notice any of the following things, you should talk to our doctors, especially if you are older than 50:

- You now have a blurred or blind spot in the center of your field of vision
- You require more light when reading
- You find it difficult to adapt to low-lit areas
- Colors do not seem as bright
- Sometimes you have difficulty recognizing faces
- Your overall vision is becoming hazy
- You are bothered by glare

*Please feel free to ask our staff or doctors if you have any questions regarding MacuHealth!*

While the 3 nutrients in MacuHealth can also be found in healthy foods such as kale, collards, and spinach, many people do not eat enough of these leafy vegetables to support the macular pigment. Many lutein supplements on the market use these leafy greens as their key ingredients. MacuHealth, however, uses lutein derived from the marigold flower. **The marigold flower has 1,200 times the amount of lutein than kale!**

Many patients begin to show noticeable differences in about 6-8 months, but the vitamins begin to improve the macular pigment layer as early as 8 weeks.

### Patients will begin to notice:

- **Reduced glare**
- **Reduced eyestrain**
- **Improved vision**
- **Increase in contrast sensitivity**
- **Increase in color vibrancy**
