

SUPER SHADE LS™

70% Dynamite LS™ Tall Fescue

15% Slider LS™ Perennial Ryegrass

15% Torsion LS™

Mixture for medium-heavily shaded areas

70% of HardiLawn mix consists of Dynamite LS Tall Fescue, the champion grass carefully bred to withstand drought, insect attack and several diseases. Other components, Slider LS Perennial Ryegrass and Torsion LS Perennial Ryegrass, stabilize the mix for various growing conditions. Being deep rooted, tall fescue performs in shade and sun and capable of withstanding summer heat and drought, while perennial rye-grasses will better survive in cooler conditions. Although slower to establish than perennial ryegrass, the tall fescue is very persistent. The patented LS components of the mix are endophyte enchaced. Endophotes, beneficial fungi living within the grass, help the plants in water management. That's why heat, drought, and pests do not affect the grass. The turf is environmentally friendly and does not need much care.

LATERAL SPREAD LAWN SEED MIXTURES

Lateral Spread lawn mixtures have a spreading tiller which fills in bare spots fast for increasing density to prevent possible weed pressures. These mixtures are fine leaved and dark green in colour. Each mix is custom designed making our seed company the only ones with this technology in Eastern Canada.

APPLICATION:

- Apply at a rate of 5-7 lbs/1000 sq ft
- Optimal seeding application time is spring or fall
- Good germination depends on adequate moisture and good seed to soil contact.
