

Auto PR

*Automatic creation of purchase requisitions for
Reorder Point (ROP) planned parts!*

Automation is being used throughout the Enterprise Resource Planning (ERP) industry to make systems more efficient by reducing manual steps and the associated overhead.

AUTO PR is a "background" process that consists of two components:

- ECI Software's **KnowledgeSync Alerts and Automation (KSAA)** application – Monitors the Microsoft SQL Server database and takes action.
- Custom SQL process – Creates a purchase requisition when on hand inventory drops below its established ROP and there are no open orders.

The result is a new Purchase Requisition (PR) in the MAX – Purchasing Control – Activity – Purchasing Schedule. The next time the buyer refreshes, it is ready for human action. Using the MAX one click Assign or Auto-Assign feature you now have a purchase order ready for the supplier!

KnowledgeSync™

*Utilize the power of KSAA to
reduce the time & effort
between the ROP trip and
inventory replenishment!*

AUTO PR supports the following types of ROP planning:

1. **Traditional Reorder Point** – Uses Part Master ROP, Reorder Quantity (ROQ) & Safety Stock data for ROP planned parts.
2. **Stockroom Reorder Point** – Uses Part Stock ROP & ROQ data for any purchased part type.

Utilizes already existing supply orders in the process.

Great for spare part stockrooms and on or offsite vendor managed inventory.

AUTO PR is just one example of how KnowledgeSync Alerts & Automation can be used to streamline workflow. Once you understand its capabilities, many more opportunities will appear.
