

Handy Data Audit

Uncover opportunities for improving Business Value

How much of your system are you really using?

Quickly assess the completeness of your ERP system implementation

The Handy Data Audit (HDA) application allows the user to summarize even the largest database within minutes. The results are a list of MAX features and functions that are licensed at your organization but may or may not be in use. These areas represent where additional benefits may be obtained from your MAX investment for very little added cost.

The HDA tool reports:

- Number of records in each MAX table.
- Number of records for system features, critical fields, and significant data.
- Enumerations for operational fields (e.g., part types, status codes, etc.).
 - Minimum and maximum date values.
 - Minimum, average, and maximum numeric values.
- Input file specifications can be tailored for specific customer analysis.
- Data violations.

Contact us for more information:

614.410.2667 | jdalessio@ecisolutions.com

Quickly identify the depth and breadth of usage within your MAX company database. Ground your management assessments with facts and not just hearsay.

Sample input files are provided for:

- All modules.
- Core modules.
- Function examples.
