PERSPECTIVE.

September 12, 2026 - Late Edition

There is something wonderfully strange happening
to the Epstein archive:
it has escaped the browser.

The Institute for Primary Facts has taken the roughly 3.5 million pages released by the U.S. Department of Justice Attachment.png and turned them into **3,437 physical volumes**. Its traveling Epstein Files Reading Room opened in Dallas this week and is now beginning a multi-city tour. The organization says the installation weighs about **17,000 pounds**.

That number stopped Yoyo mid-carrot.

Because 17,000 pounds may be the best visualization yet of a problem ESN has been wrestling with for years:

What does “transparency” mean when the evidence dump is too large for an ordinary human being to comprehend?

THE DOCUMENT DUMP PROBLEM

The DOJ says it released nearly **3.5 million pages**, plus more than 2,000 videos and 180,000 images, under the Epstein Files Transparency Act. It also explicitly cautioned that the production contains material submitted to the FBI that may be false.

That distinction matters enormously.

A document appearing in an FBI file does **not** automatically make the contents of that document true.

ESN translation:

Document exists: fact.

Someone made allegation X: possibly fact.

Allegation X is therefore true: absolutely not established merely by its presence in the archive.

This is one reason the Epstein archive remains unusually difficult terrain for journalism. Millions of pages create the appearance of total revelation while simultaneously making verification harder.

And DOJ itself acknowledges another problem: its Epstein Library warns that handwritten and otherwise awkwardly formatted material may be **unsearchable or return unreliable search results**. The Library was updated as recently as September 11.

So we now possess something close to a paradox:

More searchable evidence than the public has ever had — inside an archive that still cannot reliably be searched.

ENTER: THE WORLD'S MOST INCONVENIENT KINDLE

The Institute for Primary Facts responded by doing something almost comically literal.

They printed it.

All of it.

The resulting Reading Room contains those 3,437 bound volumes alongside exhibits and survivor-focused material. After earlier installations in New York and Washington, the organization says nearly 15,000 people attended; Dallas began the project's national tour this week. A companion Bookmobile is scheduled to carry the archive through additional communities this fall.

Independent coverage confirms the Dallas installation and its enormous physical archive. CBS Texas described millions of pages filling the space; The Art Newspaper reported that the project will travel through Texas, Iowa and Nebraska among other stops.

The project is not beyond criticism. Earlier coverage in The Guardian questioned whether converting the archive into an installation produces meaningful research access or primarily political spectacle.

That's a legitimate question.

But the physicality accomplishes something a download button cannot.

It shows people the scale of the problem.

Here's the connection I can't stop thinking about.

For years, Epstein research had a **scarcity problem**.

Documents were sealed. Records were scattered. Reporters fought for scraps.

Now it increasingly has an **abundance problem**.

Imagine walking into a library containing 3,437 books and being told:

Somewhere in here are the important bits.

Also:

Some pages contain accusations.

Some contain corroboration.

Some contain duplicates.

Some contain government paperwork.

Some contain things submitted by members of the public that may be nonsense.

Some aren't electronically searchable.

Some may matter only when connected to a completely different document hundreds of volumes away.

Congratulations.

You have invented **the Epstein Shame Network's entire reason for existing**.

The future of this investigation isn't merely obtaining documents.

It's **provenance, indexing, cross-reference, chronology and context.**

The person who discovers Document 1 is useful.

The person who realizes Document 1 contradicts Document 847,229 – while Document 2,104,661 explains why – may be considerably more useful.

That is where humans, journalists, archivists and carefully supervised machine analysis become interesting together.

Not:

AI, tell me who the bad guys are.

But:

Show me every place this claim appears. Tell me which appearances are independent. Find the earliest version. Show me what changed. Then hand the evidence back to a human.

That is a much better rabbit.

There's another development worth watching.

European investigators in Poland, Norway and Latvia told The Washington Post that requests for U.S. assistance connected to Epstein-file investigations have not yet produced the evidence they sought. DOJ says it does not discuss individual mutual-legal-assistance requests and has said it has not refused cooperation with jurisdictions investigating possible crimes.

Norway is particularly notable: three prominent figures there face corruption charges arising from scrutiny connected to Epstein relationships; all deny wrongdoing. Poland, Latvia, Britain and Germany have also pursued Epstein-related investigative questions.

So the files are doing something that the original U.S. investigation largely did not:

traveling.

Across jurisdictions.

Across newsrooms.

Across databases.

And now apparently across America in a truck containing seventeen thousand pounds of paper.
Which brings us to today's ESN maxim:

🐰 **Transparency isn't releasing the haystack.**

Transparency is helping people determine which pieces are actually needles.

The DOJ Epstein Library remains searchable here: DOJ Epstein LibraryAttachment.png

And the wonderfully insane traveling paper version is here: Institute for Primary FactsAttachment.png
