underfloor heating

Warmtech is Australia's leading supplier of electric radiant underfloor heating systems, probably the most effortless, comfortable and energy efficient form of heating available.

Warmtech custom-laid heating elements allow full coverage of the selected floor space, making tiles warm and a practical all year round solution.

Used under many products such as ceramic, porcelain, terracotta, stone, slate, marble and even timber.

The underfloor heating operating systems are easy, completely silent, invisible and maintenance free.

Electric underfloor heating provides many benefits over other forms of heating by warming the floor surface with clean, still air and radiant warmth.

Warmtech use a free running cable system, allowing full coverage of the floor, irrespective of the shape and size and also the flexibility to work around existing fixtures. The heating will only raise your floor level by approximately 3mm.

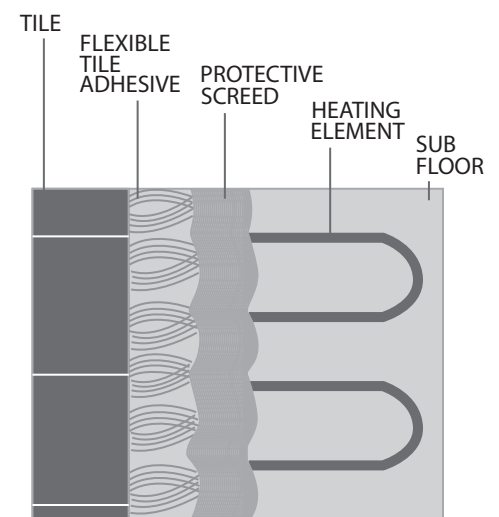

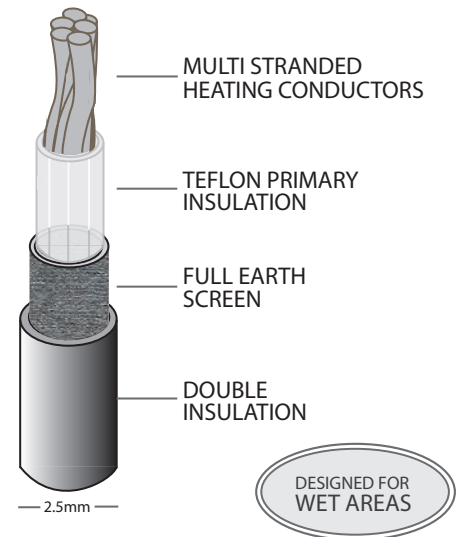

Eliminates dampness and minimises the effects of mould. Reduces the risk of asthma and allergy triggers due to a reduction in the circulation of airborne allergens.

Warmtech use a self leveling compound which provides heating element protection, even heat distribution and a flat, level surface for the ease of installation of your finished floor products.

Warmtech heating elements have been distributed worldwide for over 50 years and within Australia for more than 18 years.

Simple to operate, environmentally safe and economical to run. Warmtech's under floor electric heating offers unbeatable quality and performance.
