

Product Overview

Benefits.

Only a few ounces of CarbonWorks Replenish permanently optimizes the pH of your water. This means you can use lower rates of pesticides and foliar fertilizers to achieve the same results. Or keep your herbicide rates the same and torch tough weeds.

How it works.

CarbonWorks Replenish is a low-pH water conditioner that optimizes the pH of your spray or irrigation water while providing the additional benefits of abundant oxygen and carbon food for microbes.

Basic use.

CarbonWorks Replenish enhances every kind of spray tank mix—herbicides, insecticides, fungicides, and foliar fertilizers. It should also be used in irrigation systems to enhance crop growth. Contact your CarbonWorks representative to get recommendations for your farm.

Entirely unique.

Every once in a while, agriculture makes a technological breakthrough that challenges the farming practices of old. Time and time again, the science of our products has sent agronomists and researchers to the books to gain more understanding. The thing is, CarbonWorks isn't based on what's in the books. Our technology goes beyond.

CarbonWorks Replenish®

Spraying will never be the same.

For herbicide, foliar fertilizer, and irrigation uses, CarbonWorks Replenish® outlasts, outperforms, and hands-down knocks every other water conditioner out of the tank. When we say there's no other product like it, we absolutely mean it.

The molecules in your spray products bond to the carbon molecules in CarbonWorks Replenish.

Salts antagonize plants, causing their leaf pores to close. CarbonWorks Replenish maintains open leaf pores to deliver your spray products into the plant.

The carbon molecules in CarbonWorks Replenish move faster throughout the plant than the salts in other products, making your spray work faster and more effectively.

The energy, oxygen, and carbon found in CarbonWorks Replenish feeds beneficial soil bacteria and stimulates plant growth.
