

LIPO SHOTS vs. GLP-1 WEIGHT LOSS INJECTIONS

GLP-1 Injections (Semaglutide, Tirzepatide, etc.)

What They Do:

- Reduce appetite and cravings. Work systemically throughout the body
- Help you feel full faster. Support overall body weight loss

What They Do NOT Do:

- Do not target specific stubborn fat areas
- Do not permanently eliminate fat cells
- Do not sculpt or contour specific body zones

GLP-1 medications help change the scale — but they do not reshape areas that genetically hold stubborn fat.

Powers Lipo Shots (Deoxycholic Acid)

What They Do:

- Permanently destroy targeted fat cells
- Reduce stubborn fat pockets Sculpt and contour specific areas
- Improve shape in areas resistant to diet & exercise

Common Treatment Areas:

- Lower abdomen and Love handles
- Bra fat, Arms, and Chin

Once treated fat cells are eliminated, they are permanently removed from that area.

Which Is Better?

- Appetite control & overall weight loss → GLP-1 may help.
- Targeted fat reduction & body sculpting → Lipo Shots are designed specifically for that.

The Key Difference- GLP-1 injections help you lose weight.

Powers Lipo Shots help you sculpt your shape. *Clients using prescription weight-loss medications should inform their provider before beginning any aesthetic injectable treatments.*
