Data Analysis Diploma

Overview

Analysis of data has previously involved mostly univariate and bivariate approaches. Univariate analysis involves statistically testing a single variable, while bivariate analysis involves two variables. When problems involve three or more variables they are inherently multidimensional and require the use of multivariate data analysis. For example, managers trying to better understand their employees might examine job satisfaction, job commitment, work type (part-time vs. full-time), shift worked (day or night), age and so on. Similarly, consumers comparing supermarkets might look at the freshness and variety of produce, store location, hours of operation, cleanliness, prices, courtesy and helpfulness of employees, and so forth. Managers and business researchers need multivariate statistical techniques to fully understand such complex problems.

Data Analysis

Outlines

• The concept of data analysis

• Data analysis tools

How to use the pivot table

• Add a Slicer without converting the data to a Pivot Table

• Grouping and Ungrouping Data

• Method of merging and linking data

- Add a Slicer without converting the data to a Pivot Table
- Using equations in the Pivot Table
- Join Types
- Pivoting and Unpivoting data

- Pivot Chart
- Power Query
- Show Value As
- How to use calculated items

- Explanation of Power Query
- Dealing with Text
- Dealing with numbers
- Easily coordinate the table with minimal effort
- Dealing With Numbers (Date and Time)

**We strongly believe
in providing perfect
service to our
customers.**

Duration

2 Months

Learning System

**Blended Learning
system**

(recorded - online)

Certificate
