

Hoosier Aquatic Management Inc.

Before and After: Restoring Eroded Pond Banks with Hoosier Aquatic Management Inc.

BEFORE

Erosion damages soil, pollutes waterways, and destroys habitats. This leads to poor water quality and increased flooding issues. It also harms the infrastructure and lowers property values, posing both environmental and economic risks.

AFTER

Adding native plants to an eroded pond bank not only is aesthetically pleasing. It helps stabilize the soil by its deep growing roots, prevents erosion, and improves overall quality of water. They are low-maintenance natural wildlife habitats that adapt well to local conditions, making them a sustainable solution.
