

## If We Can't Stop New Fossil Fuel Plants

### All our Other Climate Work Won't Count For Anything

CT opened up two fracked gas power plants in the last two years and another one is "shovel-ready" for Killingly. All the major permits have been given. At this point only Governor Lamont can stop it. He has said CT doesn't need the electricity that the plant in Killingly would produce, but he hasn't shut the project down. **We have to convince him to do it.**

- The plant in northeast CT would spew 2 million tons of CO2 into the air each year.
- It's a matter of environmental justice. Northeast CT is very rural with a lot of poor people. Windham county is the poorest county in CT with the highest asthma rates.
- Killingly already has a methane burning power plant in the town and is nearby one in Rhode Island.
