

Dr. Mostafa

Thanks for your inquiry

Here is a complete explanation of our technology (ENAMEL)

In dentistry we have mainly three techniques to have a beautiful smile:

## **Crown :**

Where we do total shaving of the teeth and sometimes remove the nerve and blood supply of the tooth and cover it with a crown basically this technique was invented for the treatment of badly decayed teeth or inflamed pulp of the tooth and was done in the last stages to save a tooth but some dentist started using this technique to have a beautiful smile and we don't recommend this as it is irreversible technique that cause permanent loss of the natural sound teeth structure

Usually it is a permanent technique but it doesn't mean it will last forever it means that you can never go back to your original teeth and its life time is 10-15 years and eventually you might have to extract the crowned teeth

## **veneers :**

Usually veneers is a second option to have a beautiful smile basically veneers was invented for the repaire of a broken tooth but unfortunately it was misused by some dentists to have a beautiful smile

The idea is to shave a thin layer of your natural tooth sound structure which is 0.1 to 0.5 mm

Depend on the type of the material used for veneers and replace it with the artificial veneer

Shaving this thin layer make teeth sensitive and painful for a while and make teeth weak in general because this layer they shave is your enamel layer which protects your teeth and make it last for many years

Basically this is a permanant technique which means you can never go back to your original teeth and you have to keep doing the veneers all your life but it means also that this technique has a life time which is 7-10 years usually after that you have to do the veneers again we don't recommend this technique as well as it cause permanant loss of the natural sound teeth structures

# ENAMEL :

THIS Is an innovative technique from ivoclar vivadent the famous company in dentistry they created a material that can be bonded to the teeth without any shaving or scratching of the tooth and at the same time makes teeth whiter and straight and in one session

What is good about this technology that it is reversible

Which means at any time you can remove it and go back to your original teeth

The life time is very good it lasts from 2-4 years with good care can stay more even usually after the life time you have to renew it with new material by polishing the old material and applying the new material or staying back with your original teeth

Usually no harm at all to the original teeth as it is bonded with the universal bond which is used for bonding filling - braces or dental materials

What is also good about the technology is the cost which means it is affordable for a lot of people

If you wish to know more about our services you can just schedule an evaluation which can be online or physical depend on your needs our evaluation is free and then if you feel good you can book your one session 2 hours visit us and get your new smile delivered on the same day and enjoy a new beautiful white straight teeth.
