

Do you know what information is publicly available about **your network?**

Hackers can use publicly
accessible data to find gaps.

Our free Attack Surface Report will **show you yours.**

What is an Attack Surface?

An Attack Surface is the number of points, or attack vectors, across your IT network where unauthorized users could exploit vulnerabilities to gain access to systems, extract confidential data, and stage an attack.

What is the Attack Surface Report?

This report shows what a hacker can find out about your network from using publicly available data. It focuses on your infrastructure which is directly connected to the internet.

Why does this matter?

Gaining controls of an organization's internet-facing equipment is a common attack vector. It's important that this equipment is configured correctly to prevent security and privacy incidents.
