

Oklahoma aka Texas Whitebud

Cercis c. ssp Texensis 'Oklahoma Whitebud'

Also known as **Texas Whitebud**, this tree was discovered growing natively in Texas. It is a compact growing, drought tolerant tree that produces clusters of thickly packed, clean white flowers. This subspecies is better adapted to drier areas than straight *C. canadensis*. Overall, the habit is more compact than that of your typical **Eastern Redbud** and the best part is its high-gloss, dark green leaves with their characteristic wavy margins. 12'-15' h & w. Partial sun is best.
