

Greeneyes

Berlandiera texana

An unbelievable, extremely long-lived perennial native from the High Plains of Texas all the way down to Corpus Christi. A very long bloomer from April to November, Greeneyes produces a mass of 1"-2" bright yellow, eight petaled flowers on top of 2'-3' stalks in heavy bloom cycles spring, summer and again in the fall. It's named for the bright green eye in the center. It adapts to any well drained soil & does best in full sun. The foliage has a wonderful velvety texture to it & is greenish-blue in color. Cut back after a heavy bloom cycle to encourage fuller plants.
