John Gregor

The meeting focused on a presentation about night and twilight landscape photography.

John explained his equipment, including Fuji cameras and wide-angle lenses, and recommended using a sturdy tripod, cable release, and a flashlight for focusing. He described planning tools like PhotoPills and Bortle maps to find dark skies and the best times to photograph the Milky Way core. He detailed camera settings, emphasizing manual focus, manual exposure, and the importance of shooting in RAW to capture more tonal information in the shadows. John demonstrated the spotlight method for focusing on foreground elements and explained how to use histograms to ensure proper exposure. He shared examples of his work, including light painting techniques using small lights and flashlights to illuminate subjects like lighthouses, old buildings, and people. He also covered star trails, including how to find the North Star, and provided tips for shooting night sky panoramas with proper tripod leveling and image overlap.
