Unique dual-key encryption

Your account is secured with two powerful layers of protection: a password – which we never store and only you know – and a 128-bit encrypted Secret Key.

Protect data in transit

Secure Remote Password authenticates your account without sending your credentials over the Internet. This prevents anyone from stealing your data while it's in transit.

Alerts you to security breaches

Watchtower alerts you to password breaches and other security problems with your saved items.

Only works in verified browsers

1Password only fills your details after it verifies that your browser has been signed by an identified developer.

Removes secrets from your clipboard

To prevent people or clipboard tools from learning your secrets, 1Password regularly removes item details from the clipboard.

Always requires your input

To protect your data from shoulder surfers and browser-based attacks, 1Password only displays or fills data when you tell it to.
