

WINTER WATERING

It's easy! Water once a week when daytime temperatures exceed 40°F.

WHY?

It's important to water your garden during winter in Colorado. When temperatures are above 40°F, to ensure that your plants receive enough moisture to survive the cold months. Providing consistent hydration helps prevent the roots from drying out, which can be a risk even in cooler weather. Additionally, maintaining healthy roots supports your plant's resilience, making it more likely to flourish once spring arrives. Regular watering can also help protect your plants from potential frost damage, ensuring that your garden remains vibrant and ready to bloom beautifully when the warmer months return.

HOW?

- Choose the Right Time: Water during the warmest part of the day.
- Watering Technique: Utilize a 5-gallon bucket, pouring it gradually around the base of the tree. For each inch of trunk diameter, use one bucket of water (e.g., a 3" trunk requires 3 buckets). Alternatively, you can use a hose on a slow trickle; for every inch of trunk, let it run for about 15 minutes (e.g., a 3" trunk needs about 45 minutes).
