Selection and Calculation of Slewing Rings

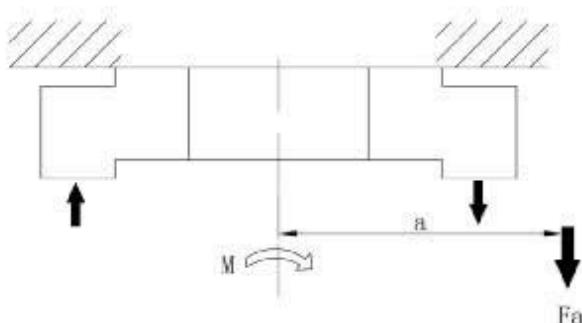

Supporting Load of Slewing Ring

During the use of slewing ring, it is usually endure axial force, radial force and overturning moment together. For different application situation, due to the vary of working manner and structure form, the fuction combined condition also different of the above three loads. Sometimes may be the combination of two loads, sometimes may be only one load.

Generally speaking, installation of slewing ring have two kinds of mode: compressive installation and suspended installation. The load of the bearing of this two kinds of installation see as follows:

Compressive Installation

Suspended Installation

If the slewing ring is compressive installation, the customer could select and calculate as follows; if the slewing ring is suspended installation, please contact our Engineering Department for assistance.

Selection of Slewing Ring

Selection of Structure

Common structure of slewing ring have four kinds: single row ball slewing ring, cross-roller slewing ring, double-row different diameter ball slewing ring, three-row roller slewing ring.

Based our experience and calculation, we have follow conclusion:

- Do ≤ 2000, single row ball slewing ring first; Do > 2000, three-row roller slewing ring first.
- For the slewing ring have the same figure size, the load capacity of single row ball slewing ring is more than the cross roller and double-row different diameter slewing ring.
- Single row ball slewing ring of Q-series have higher compact structure, less weight and more economically. They are the first chose of single row ball slewing ring.

2.

Select Product Type by Calculation

(1)

Calculation of single-row ball slewing ring

Calculation of rated static capacity

$$C_0 = 0.6 \times D_o \times d_o^{0.5}$$

C_0 —————

kN

Rated static capacity

D_o —————

mm

Diameter of track center

d_o —————

mm

Diameter of ball

(2)

Equivalent load calculation according outside compound load

$$C_p = F_a + 4370M/D_o + 3.44F_r$$

Selection and Calculation of Slewing Rings

Cp _____ kN Equivalent axial load

M _____ kN · m Overturning moment

Fa _____ kN Axial force

Fr _____ kN Radial force

(3) $f_s = C_o / C_p \geq f_o$

See the following table

(2)

Calculation of 3-row roller slewing ring

Calculation of rated static capacity

$$C_o = 0.534 \times D_o \times d_o^{0.75}$$

Co _____ kN Rated static capacity

Do _____ mm Diameter of track center

do _____ mm Upper row roller diameter

(2) $C_p = F_a + 4500M/Do$ Equivalent load calculation according outside compound load

Cp _____ kN Equivalent axial load

M _____ kN · m Overturning moment

Fa _____ kN Axial force

(3) $f_s = C_o / C_p \geq f_o$

See the following table

Safety Factor of Slewing Ring f_o

Working condition	Characteristic	Example	f_o
Light duty	Not often full load, smooth slewing, small impact	Stacker, truck cranes, non-port wheeled cranes	1.00~1.15
Middle duty	Not often full load, slewing quickly, impact	Tower cranes, marine cranes, crawler cranes	1.15~1.30
Heavy duty	Often full load, heavy impact	Clamshell grabing cranes, harbour cranes, single bucket excavator, container cranes	1.30~1.45
Extremely heavy duty	Full load, heavy impact or working condition badly	Bucket wheel excavators, tunnelling machines, metallurgical cranes, offshore work platform cranes	1.45~1.70

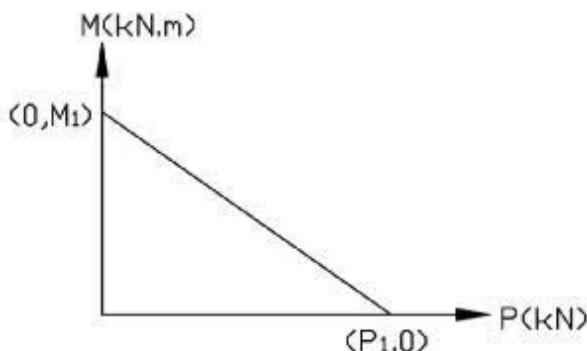

3.

Select Product Type Use Static Load Curve

Static load curve show the maximum load of slewing ring when in the static state. Each type of the slewing ring in this specimen has a corresponding load capacity curve. Load capacity curve can help customer to make an elementary chose of slewing ring.

Draw the static load curve. Customer draw the static load curve based on the type which wanted to be selected. See as follows:

Selection and Calculation of Slewing Rings

$$P_1 = C_o$$
$$M_1 = C_o \cdot D_o / 4370 \text{ (三排柱式: } M_1 = C_o \cdot D_o / 4500 \text{)}$$

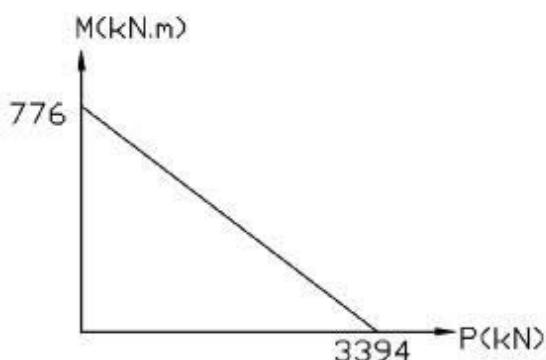

The point which total axial force F_a and total overturning moment M multiply the safety factor respectively should located below the static load curve.

Example: Draw the static load curve of QUA1000.32

$$P_1 = C_o = 0.6 \times 1000 \times 32^{0.5} = 3394 \text{ kN}$$

$$M_1 = C_o \cdot D_o / 4370 = 3394 \times 1000 / 4370 = 776 \text{ kN}\cdot\text{m}$$

Static load curve see as following:

Technical Parameter of Slewing Ring Selection

After making an elementary chose of slewing ring, customer could confirm the selecting result together with our Engineering Department or provide some informations about slewing ring to our company. When the selection is made by our company, please filling 'Technical References Concerned for Selection of Slewing Ring of Maanshan Tongli Slewing Ring CO.,LTD' in detail, so as to provide you economical and suitable selection of the slewing ring as soon as we can.

Selection and Calculation of Slewing Rings

Selection and Calculation of Slewing Rings

Appendix: Confirmation of the Load Outside the Slewing Ring

- a. M , N · mm;
- b. F_a , N;
- c. M F_r , N.

When selecting the slewing ring, customer first to confirm the outside load of the slewing ring. The outside load of single row ball slewing ring is the total load after combination which include:

- a. overturning moment M , N-mm
- b. total axial force F_a , N
- c. total radial force F_r of the functional surface of total overturning moment M

When the outside mechanical force composing the outside load, customer should put working condition factor K into consideration which based on the working type of the machine. The following are examples of crane and excavator which explain the confirmation of outside load. (The listed calculational position not always represent the abominable condition of working condition, customer should calculate according to the maximum working condition.

1. Crane (see figure 1)

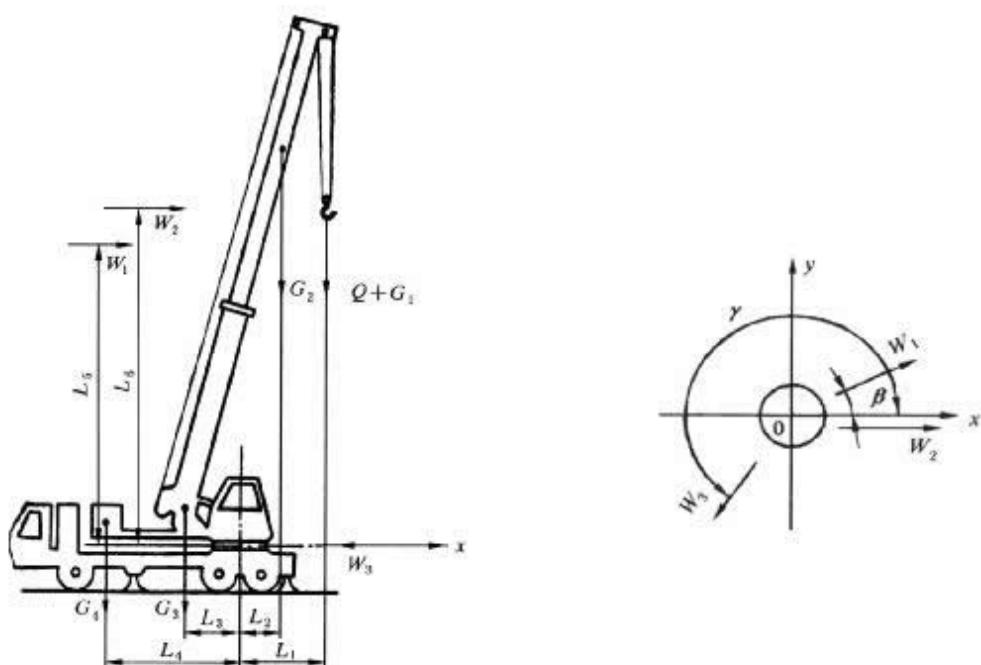

Figure of Crane Calculation

$$F_a = [K \cdot (Q + G_1) + G_2 + G_3 + G_4] \cdot g$$

$$M = [K \cdot (Q + G_1) \cdot L_1 + G_2 \cdot L_2 + G_3 \cdot L_3 + G_4 \cdot L_4] \cdot g + W_1 \cdot L_5 \cdot \cos\beta + W_2 \cdot L_6$$

$$F_r = W_1 \cdot \cos\beta + W_2 + W_3 \cdot \cos\gamma$$

Q —

KG Maximum rated lifting weight under this working condition, kg;

G_1 —

kg;

Weight of hoist tool

G_2 —

kg;

Weight of amplitude part

G_3 —

kg;

Weight of turntable

G_4 —

kg;

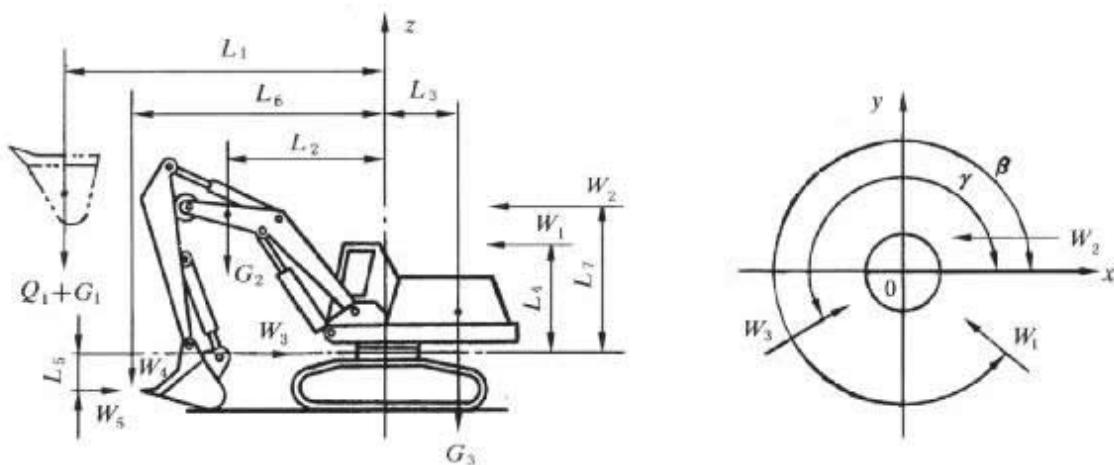

Balance weight

Selection and Calculation of Slewing Rings

W_1	Horizontal force of inertia
W_2	Wind force
W_3	Meshing force of gear
L_1	Working amplitude
L_2	Horizontal distance from gravity of amplitude part G_2 to slewing center
L_3	Horizontal distance from gravity of turntable G_3 to slewing center
L_4	Horizontal distance from gravity center of balance weight to slewing center
L_5	Vertical distance from point of horizontal force of inertia W_1 to slewing ring
L_6	Vertical distance from point of wind force W_2 to slewing ring
g	$1, g \approx 9.8 \text{ m/s}^2$; Gravity acceleration
β	Angle between horizontal force of inertia W_1 and M surface
γ	Angle between meshing force of gear W_3 and M surface
K	Working condition factor, decide by table 1.

2.

Excavator(see figure 2)

Figures of Excavator Calculation

2.1 Full Bucket Revolution Condition

$$Fa = [k \cdot (Q + G_1) + G_2 + G_3] \cdot g$$

$$M = [k \cdot (Q + G_1) \cdot L_1 + G_2 \cdot L_2 - G_3 \cdot L_3] \cdot g + W_1 \cdot L_4 \cdot \cos\beta + W_2 \cdot L_7$$

$$Fr = W_1 \cdot \cos\beta + W_2 + W_3 \cdot \cos\gamma$$

2.2 Excavate Condition

$$Fa = k \cdot W_1 + [k \cdot (Q + G_1) + G_2 + G_3] \cdot g$$

$$M = k \cdot W_4 \cdot L_6 + [K \cdot (Q + G_1) \cdot L_1 + G_2 \cdot L_2 - G_3 \cdot L_3] \cdot g + K \cdot W_5 \cdot L_5 + W_2 \cdot L_7$$

$$Fr = W_2 + W_3 \cdot \cos\gamma - W_5$$

Selection and Calculation of Slewing Rings

Q ——	Material mass in full bucket condition
G_1 ——	Bucket weight
G_2 ——	Weight of amplitude part
G_3 ——	Weight of non-amplitude part of turntable
W_1 ——	Horizontal force of inertia in revolution condition
W_2 ——	Wind force
W_3 ——	Meshing force of gear
W_4 ——	Vertical excavate force
W_5 ——	Horizontal excavate force
L_1 ——	Horizontal distance from gravity of bucket and material to slewing center
L_2 ——	Horizontal distance from gravity of amplitude part G_2 to slewing center
L_3 ——	Horizontal distance from gravity of non-amplitude part of turntable G_3 to slewing center
L_4 ——	Vertical distance from horizontal force of inertia in revolution W_1 to slewing ring
L_5 ——	Vertical distance from horizontal excavate force W_5 to slewing ring
L_6 ——	Horizontal distance from vertical excavate force W_4 to slewing center
L_7 ——	Vertical distance from point of wind force W_2 to slewing ring
β ——	Angle between horizontal force of inertia W_1 and M surface
γ ——	Angle between meshing force of gear W_3 and M surface
K ——	Working condition factor, decide by table 1.

Table 1 working condition factor K

Working condition	Example	K
Light duty	Stocker, truck cranes, non-port wheeled cranes,	1. 10~1. 25
Middle duty	Tower cranes, marine crane, scrawler cranes	1. 20~1. 35
Heavy duty	Clamshell grabbing cranes, harbour cranes, container cranes	1. 30~1. 50
	Single bucket excavator, dredger, offshore work platform cranes	1. 40~1. 70
Extremely heavy duty	Bucket wheel excavators, tunnelling machines, metallurgical cranes	1. 60~2. 00

Slewing Ring Usage

Requirement of Installation and Usage

1. The soft zone(shown by a letter 'S' stamped on a surface of the gear ring) and the loading plug should be located at non-loading area,non-always loading area or slightly loading area.

2. The mounting surface must keep clean and flat, and should not have scrape, burr formation and other extraneous material on it. The flatness of mounting surface should accord with table 2.

The permissible flatness values including angle deviation

Diameter of track center D_t (mm)	The flatness of supporting bracket		
	Four point contact of single row	Double-row ball	Roller
~1000	0.15	0.20	0.10
>1000~1500	0.19	0.25	0.12
>1500~2000	0.22	0.30	0.15
>2000~2500	0.25	0.35	0.17
>2500~4000	0.30	0.40	0.20

3. The mounting platform should have enough rigidity to avoid the slewing rings failure of work due to the deformation of slewing rings installation which caused by lacking rigidity installing frame. The maximum deformation should accord with table 3 under rated load.

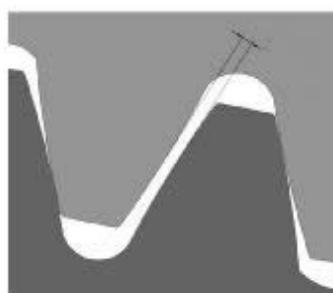

Deflection under permissible maximum load

(D) Diameter of track center	~1000	>1000~1500	>1500~2000	>2000~2500	>2500~3000	>3000~3500	>3500~4000
Max (mm) The maximum deflection of frame's flat surface	0.6	0.8	1.0	1.2	1.5	2.0	2.5

Notice of gear installation:

External gearing: The backlash between gear and pinion should not less than 0.03m(m is module).

Internal gearing: The backlash between gear and pinion should not less than 0.06m(m is module).

Slewing Ring Usage

Notice of Selection and Installation of Bolt

1. You can select the bolt of GB3098.1 and GB5782, and also could design the hexagon head bolt by yourself. The performance classification include 8.8, 10.9 and 12.9.

It is usually use 10.9 level of bolt in the commonly construction machine.

If there is a strictly requirement on bolt static strength under rated load and bolt yield strength under maximum load but not rigid on fatigue strength, you can use 12.9 level bolt.

In the condition that load change frequently and have extreme demand on bolt fatigue strength, you'd better choose 8.8 level bolt.

2. Tightening nut have GB3098.2, GB6175 and also could design the hexagon head nut by yourself. The performance classification should accord with the bolt.

3. The use of any type of elasticwasher is forbidden. It is advised to use quenched and tempered flat washers which has lockvein on double-face or use double nuts. When use double nuts, two nuts can select from GB6170; or select one thick outside nut from GB6175 and one thin inside nut from GB6172. The material of two nuts must use the same one.

4. When tightening the bolt, the screw thread and nut should be greased and using torque wrench symmetrically tightening bolt several times along the 180°direction. See figure 3:

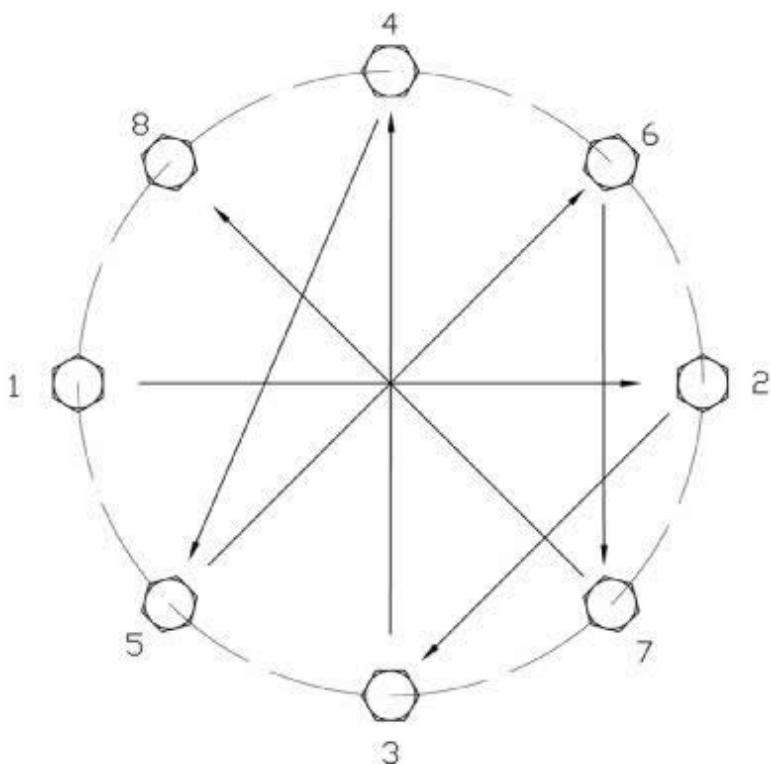

figure 3

Slewing Ring Usage

5. Bolt must have enough pre-tighten force, and the produced pre-tighten stress on it should accord with table 4.

Pre-tightening torque or forces of bolts

Specifications of bolts	(GB/T3098.1-2000) Bolt's strength class		
	8.8	10.9	12.9
	Pre-tightening torque M_s (N·m)		
M10	44	62	75
M12	77.5	110	130
M14	120	170	210
M16	190	265	320
M18	260	385	435
M20	370	520	620
M22	500	700	840
M24	640	900	1080
M27	950	1350	1620
M30	1300	1800	2160
Pre-tightening force F_s (10 ³ N)			
M33	293	412	495
M36	344	484	581
M39	414	584	698
M42	473	665	798
M45	553	777	932
M48	623	876	1050
M52	749	1054	1265
M56	863	1214	1457
M60	1008	1418	1621

6. When using screw connection, the length t of bolt screwing into the slewing ring should meet the requirement of table 5.

Bolt performance class	8.8	10.9	12.9
t	0.70T	0.75T	0.8T

Note: T is the length of screw thread

7. In order to insure the reliability of bolt, avoid it appears lack of pre-tightening force, we recommend checking the pre-tightening torque of the bolt after first 100 hours and 500 hours of use.

Slewing Ring Usage

Packaging, Transport and Maintenance of Slewing Ring

1. Packaging

At present, our products generally use three kinds of packaging: non-wooden packaging, wooden packaging, wood care packaging.

1)Non-wooden packaging This type of packaging is fit for short-distance transport. After painting the anti-rust coating oil, inner layer of the slewing ring wrapping with flax tightly, the outer wrapping with plastic sheeting, and could put several together using metal band.

2)Wooden packaging Who need repeated transfer or long-distance transport of slewing ring must be in wooden packaging. Single or multiple packaged slewing ring could together with metal band, and fixed in a wooden box.

3)Wood care packaging This type of packaging is the main mode of transport for long distance.

2. Transportation

1)Slewing ring handling in the loading and unloading process should be done gently, and non-throwing, hitting. Weighting more than 30kg slewing ring, it should be use lifting holes when in the handling process.

2)Slewing ring must be horizontal in the transport. For the non-wooden packaging of slewing ring, the bottom must be put in wooden pads and should have anti-slip steps.

3)For the diameter greater than 3000mm or easily deformed slewing ring, bearing should have assistant supporting.

3. Maintenance of the Slewing Ring

1) The slewing ring had been filled a few of No.3 lithium based grease in the race before delivery. Consumers should fill the new grease suitably according to different working condition before use it. Generally, it is necessary to fill in grease once every 100 hours for ball slewing ring, and once every 50 hours for roller slewing ring. When filling in lithium based grease, it must make the grease even till the grease out off from the sealing. The filling period should be shorten if there is the special working condition such as at the torrid zone, high humidity, severe dust, large temperature variation and long continuing working time.

2) It should be filled with new grease before and after the machine being long time stop working.

3)The gear faces exposed in air should periodically cleaned and spread with appropriate oil on it.

4) In general working condition, check the pre-tighten force of the bolts after first 100 working hours then check it every 500 hours of the slewing ring. It must be always kept enough pre-tighten force.

5) Cleaning the slewing ring with high-pressure water is not permissible during operation so as to aviod the water entering to the rolling race.

6) Stop and check the machine during operation if there is abnormal noise, vibration occurred or suddenly power rose. Remove the trouble or dismantle it for repairing if necessary.

7) Should not let the hard materials access or enter in the engaging area of the gear.

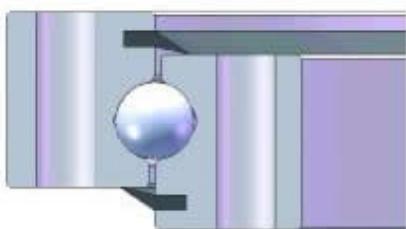

8) Regularly check the seal ring is that OK or not. Replace it if it is damaged and reset it when it is fallen.

9) Multi-slewing rings overlapping together horizontally must put at least 3-5 pads evenly in the direction of circumference between the slewing rings. And the upper and lower pads put in the circumferential direction of the position should be consistent. Slewing ring stand up is prohibited.

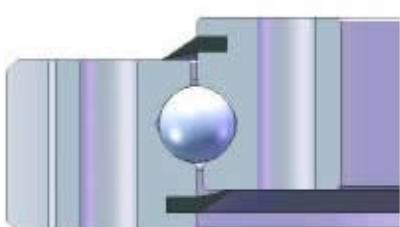

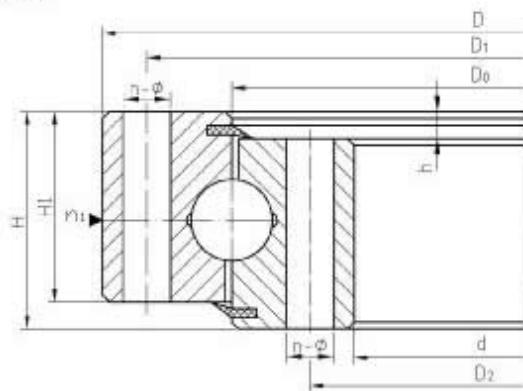

10) Slewing ring should be placed on non-corrosive medium, and stored in dry, flat indoor room, can not be soaked or watered.

NOTE:

- 1.Q series are more scientific, reasonable and economic than OI series, please see the detail article of 'The effect of slewing ring product standard to reasonable selection' in the third issue in 2002 of 'Construction Mechanism' or consult the website of our company.
- 2.No teeth slewing ring consists of outside gear D and inside gear d with the same track center diameter. The plug and oil-hole are located on the outer ring.
- 3.In Standard Series JB2300-1999, more than the diameter of ball 30, we add to the series of small diameter of ball, the series are twice, but the other data is the same. OI series is omitted in the table.
- 4.T is the length of screw.
