

## **Carpet cleaning in Odessa, FL.**

Homeowners living in Odessa know that the steamy Florida Climate can create a number of problems in their carpet. The high humidity creates an incubator for mold and mildew in carpets. Not only will this cause a dark, dirty appearance on your carpet, but it also poses a serious health risk. According to WebMD when someone comes into contact with mold spores originating from the carpet can cause reactions including sneezing, runny nose, and red itchy eyes. Asthma sufferers can also experience breathing problems when inhaling mold spores. Mold Spores are also potentially more of a risk for people who are fighting a terminal illness or have a compromised immune system. We know how potentially destructive humidity can be, that is why we use a low moisture cleaning system that is dry within a few hours. We also deodorize as we clean so that we can remove the musky smell that mildew produces.

In the months where it does not rain every afternoon in Florida, another issue may present itself, especially in homes where the pets go in and out as they please. Fleas are abundant in the sand in and around Odessa. Cats in particular love to roll in the sand, picking up many of these parasites and their eggs. Once your pet has acted as transportation for the fleas to enter your home, they quickly spread to the carpet. Spraying an insect killer to eliminate fleas is not enough on its own, these resourceful creatures will crawl to the bottom of the carpet and avoid being sprayed and lay eggs that will hatch days afterward. Deep cleaning of carpets is the only way to be sure they are removed. Regular carpet cleaning is part of a regimen to rid a home of a flea infestation and ensure that they don't return.

Another unwelcome visitor who may take up residence in your carpet is the dust mite. These microscopic creatures are nearly as bad for your health as mold and mildew. While being somewhat gross, it is a fact that dust mites survive on dead skin. Over time an abundance of dead skin can build up in carpets not frequently cleaned. The result is a corresponding abundance of dust mites deep in the carpet fibers. Equally as gross is the mechanism by which dust mites trigger allergies and asthma. After gorging themselves on dead skin in your carpet, they produce feces that are easily airborne. After breathing in the dust mite feces, you can have all the same problems from mold. Sneezing, itchy eyes, skin rashes, and breathing problems in people with asthma are common reactions to dust mite feces. Complete Care Systems will deep clean your carpet and remove all the dead skin, dust mites and their waste.
