

Integration Technique Cheat Sheet

<b>Integration Technique</b>	<b>When to use this method</b>	<b>The Method</b>	<b>Example</b>
<b>U-sub</b>	When you have reverse chain rule $\int f(u(x))u'(x)dx$	Choose u and compute du so that $\int f(u)du$ is integrable.	$\int \frac{x^2}{\sqrt{4x^3 + 2}} dx \quad u = 4x^3 + 2 \quad du = 12x^2 dx$ $= \frac{1}{12} \int \frac{12x^2}{\sqrt{4x^3 + 2}} dx = \frac{1}{12} \int \frac{du}{\sqrt{u}}$
<b>Trigonometric Identities</b>	When you are given $\int \sin^k(x)dx$ or $\int \cos^k(x)dx$	$k$ is even = use the half angle formulas $\cos^2(x) = \frac{1 + \cos(2\theta)}{2}$ $\sin^2(x) = \frac{1 - \cos(2\theta)}{2}$ $k$ is odd = "save" one of the functions for the du, and substitute the rest with the identities $\cos^2(x) = 1 - \sin^2(x)$ $\sin^2(x) = 1 - \cos^2(x)$	$\int \cos^4(x)dx = \int \left(\frac{1 + \cos(2\theta)}{2}\right)^2 d\theta$ $= \int \frac{1}{4}(1 + 2\cos(2\theta) + \cos^2(2\theta))d\theta$ $= \int \frac{1}{4}\left(1 + 2\cos(2\theta) + \frac{1 + \cos(4\theta)}{2}\right)d\theta$ or $\int \cos^3(x)dx = \int (1 - \sin^2(x))\cos(x)dx$ $= \int 1 - u^2 du$
<b>Integration by Parts (traditional)</b>	When you have the product of two functions but neither is the derivative of the other $\int f(x)g(x)dx$	Choose $u = f(x)$ and $dv = g(x)$ $du = f'(x) \quad v = \int g(x)dx$ $\int u dv = uv - \int v du$	Choosing u (log, inverse trig, algebraic, trig, exp) $\int \sin(x)e^x dx = \sin(x)e^x - \int e^x \cos(x)dx$ $u_1 = \sin(x) \quad dv_1 = e^x \quad u_2 = \cos(x) \quad dv_2 = e^x$ $du_1 = \cos(x) \quad v_1 = e^x \quad du_2 = -\sin(x) \quad v_2 = e^x$ $\int \sin(x)e^x dx = \sin(x)e^x - \cos(x)e^x - \int \sin(x)e^x dx$ $2\int \sin(x)e^x dx = \sin(x)e^x - \cos(x)e^x$ $\int \sin(x)e^x dx = \frac{1}{2}e^x(\sin(x) - \cos(x))$
