

DID YOU KNOW YOUR HALLOWEEN DECORATIONS ARE HARMFUL?

Your Outdoor Decorations Could Be Deadly

The photo you see here is a real consequence of fake cobwebs. Birds, bats, and vital pollinators like bees cannot see these fine synthetic strands at dusk.

Once they fly into them, they become hopelessly entangled. Hedgehogs get caught in them and struggle so desperately they choke, or lose limbs.

Why Fake Cobwebs are a Threat:

- **They act like real mist nets:** Synthetic webs are strong, elastic, and don't break easily. Entangled animals quickly exhaust themselves or choke trying to escape.
- **Long-lasting pollution:** These plastic-based fibres don't break down. If they blow away, they continue trapping wildlife elsewhere, permanently.

Please keep them inside. Stretchy fake webs look great indoors across windows, mirrors, or walls where wildlife can't reach them.

Thank you for helping protect our local neighbourhood wildlife this autumn!
