

How To Use the “All Talk Groups in CSV” File.

The “All Talk Groups in CSV – MM/DD/YYYY” file lists all talk groups as per Brandmeister based use cases and is 98% accurate for DMR+, DMR-MARC and other networks.

This was originally exported out of K2GOG’s MD-380 through the use of the NOGSG DMR Contact Manager Software.

It is advisable to import this file using the same NOGSG software into your code plug and into your radio.

This is an ongoing list and will likely never be perfect.

If you make a good number of changes, please save and send back to info@hvdn.org in a ZIP folder.

With the use of the user database function for “Caller ID” like functions for all registered DMR users, you can use the “Digital Contacts” in your radio to store all the talk groups instead. This is why this file exists.
