

What happens with a Harmony prenatal test:

1

At 10 weeks or later, your blood is drawn.

2

Your blood sample is sent to a laboratory where it is analyzed.

3

Your results are sent to your healthcare provider in about seven business days.

For clear answers

Screening with the Harmony test identifies more than 99% of pregnancies with Down syndrome, whereas traditional screening misses as many as 20% (1 in 5).³

For fewer false alarms

The Harmony test performance is superior to traditional screening for Down syndrome.

With the Harmony test, there is less chance your doctor will recommend follow-up testing due to a false-positive result, and you can avoid needless anxiety.⁴

For information you can trust

You trust your doctor to guide you safely through every step in your pregnancy with clear advice that is based on high-quality, clinically proven tests.

The Harmony prenatal test offers the accuracy your doctor needs to answer your questions with confidence and give you peace of mind about the health of your baby.

What to expect from Harmony results:

The Harmony test is a screening test. That means it looks for evidence of the conditions listed in this brochure, but like any screening test, it does not provide a diagnosis.

Your Harmony test results can guide the discussions you have with your doctor about your pregnancy care.

information, talk to your healthcare provider or visit www.harmonytest.com

The Harmony non-invasive prenatal test is based on cell-free DNA analysis and is considered a prenatal screening test, not a diagnostic test. Harmony does not screen for potential chromosomal or genetic conditions other than those expressly identified in this document. All women should discuss their results with their healthcare provider who can recommend confirmatory, diagnostic testing where appropriate.

The Harmony prenatal test was developed and its performance characteristics determined by Ariosa Diagnostics, Inc. a CLIA-certified and CAP-accredited San Jose, CA USA. This testing service has not been cleared or approved by the US Food and Drug Administration (FDA).

* Any risk refers to the average risk population (under age 35) and high risk population (over age 35). The Harmony test has been studied in women ages 18-48. Pregnancies with more than two fetuses, a history of vanishing twin, maternal organ transplant or maternal aneuploidy are not eligible for the Harmony test.

1. Demonstrated by 48 peer-reviewed published studies using the Harmony prenatal test as of Jan 2018. For the entire 48 references, please go to harmonytest.com/references

PRENATAL TEST

harmony
PRENATAL TEST

For You

it's the most proven non-invasive prenatal test available¹ and it's peace of mind.

Clear answers to questions that matter.

For the health of your baby

Clear answers are everything when you're pregnant, especially when it comes to the health of your baby.

You want the best information, so you can make plans and have peace of mind for the months ahead.

The Harmony test is the most proven brand of noninvasive prenatal test (NIPT) available.¹ It has been used in more than 1 million pregnancies worldwide.²

What is the Harmony prenatal test?

Harmony is a safe blood test that screens for specific chromosome conditions in a pregnancy as early as 10 weeks gestation.

When you're pregnant, your blood contains tiny amounts of your baby's DNA. The Harmony prenatal test looks at this DNA to provide accurate information about the likelihood for the most common chromosome conditions such as Down syndrome (trisomy 21), trisomy 18, and trisomy 13.

What else can the Harmony test do?

In addition to screening for the conditions listed above, you and your healthcare provider can talk about which of the following additional options might make sense for your pregnancy.

- Fetal sex – So you know whether your baby is male or female (also available with twins)
- Monosomy X – Also called Turner syndrome, a condition where a female is missing an X chromosome, and as a result, may have heart, endocrine, and learning problems
- 22q11.2 microdeletion – A condition caused by a small missing piece (“microdeletion”) of chromosome 22, which can result in heart, kidney, learning, and growth problems
- Sex Chromosome Aneuploidy – Differences in the number of X and Y chromosomes which can result in certain learning and/or behavioral challenges in addition to other health issues

Who should have this screening?

The American College of Obstetricians and Gynecologists (ACOG) now recommends that **all pregnant women** be offered screening and diagnostic testing for Down syndrome.⁵

Down syndrome does not typically run in families and can happen in any pregnancy. Although the chance of having a baby with Down syndrome increases with age, most babies with Down syndrome are born to women under 35.⁶

Why choose the Harmony test?

The Harmony prenatal test is better at identifying Down syndrome with fewer false positives than traditional screening tests for women of any age or risk.³

HARMONY VERSUS TRADITIONAL TESTS FOR DOWN SYNDROME³

	DETECTION RATE [*]	FALSE-POSITIVE RATE ^{**}
HARMONY Prenatal Test	More than 99 in 100	Less than 1 in 1,600
TRADITIONAL First-Trimester Screening	79 in 100	1 in 20

^{*} Correctly indicates a high risk for Down syndrome when it IS present

^{**} Reports a high risk for Down syndrome when it is NOT actually present
